1. Background

Agricultural organizations are increasingly targeted by cybercriminals who steal sensitive data including crop yield predictions, soil composition formulas, irrigation schedules, and farm credentials. This stolen data is often traded on dark web marketplaces accessible only through the Tor network. Traditional security monitoring tools cannot access or analyze dark web content, leaving agricultural assets vulnerable to undetected data leaks.

1.1 Aim

To design and develop an automated dark web monitoring system that:

1. Crawls .onion websites anonymously through the Tor network
2. Extracts agricultural data leaks, credentials, and proprietary information
3. Classifies threats using machine learning and natural language processing
4. Generates real-time alerts via email and Slack
5. Learns from analyst feedback to improve detection accuracy over time

1.2 Technologies

Category	Technologies Used
Programming Language	Python 3.13
Tor Integration	Stem, PySocks, Tor (SOCKS5 proxy)
Web Crawling	Requests, BeatifulSoup4, urllib3
Text Processing	NLTK, spaCy, regex, tldextract
Machine Learning	Scikit-learn (Random Forest), Transformers (BART)
Natural Language Processing	Hugging Face Transformers, Zero-shot classification
Database	SQLite, SQLAlchemy ORM
Alerting	SMTP (email), Webhooks (Slack)
Dashboard	Flask, Socket.IO, Chart.js
Logging	Python logging module

1.3 Hardware Architecture

1.3.1 Minimum Hardware Requirements

The Dark Web Agriculture Monitor is designed to run on standard computing hardware without requiring specialized infrastructure. The following specifications represent the minimum and recommended configurations.

Component	Minimum Requirement	Recommended Requiremnts
Processor (CPU)	Intel Core i3	Intel Core i5/i7
RAM	4 GB	8-16 GB
Storage	2 GB free space	5 GB free space
Network	10 Mbps internet connection	25+ Mbps internet connection
Operating System	Windows 10 / Ubuntu 20.04	Windows 11/ Ubuntu 22.04

1.3.2 Component-Level Analysis

- Processor (CPU) Requirements

System Component	CPU Usage	Explanation
Tor Daemon	5-10%	Background service for routing traffic through Tor network
Web Crawler	10-20%	Parsing HTML, extracting links, making HTTP requests
Preprocessor	15-25%	Text cleaning, regex operations, entity extraction
BART NLP Model	30-50%	Transformer inference for intent classification
ML Classifier	5-10%	Random Forest prediction with 10 features
Database	5-10%	SQLite read/write operations
Flask Dashboard	5-10%	Web server and Socket.IO connections

- Memory (RAM) Requirements

Component	Memory Usage	Peak Usage
Tor Daemon	50-100 MB	150 MB
Python Interpreter	50 MB	100 MB
BART Model (500MB)	500 MB (loaded)	600 MB
Crawler (BeautifulSoup)	50-100 MB	200 MB
Preprocessing (NLTK, spaCy)	100-200 MB	300 MB
Database (SQLite)	20-50 MB	100 MB
Dashboard (Flask)	50-100 MB	150 MB

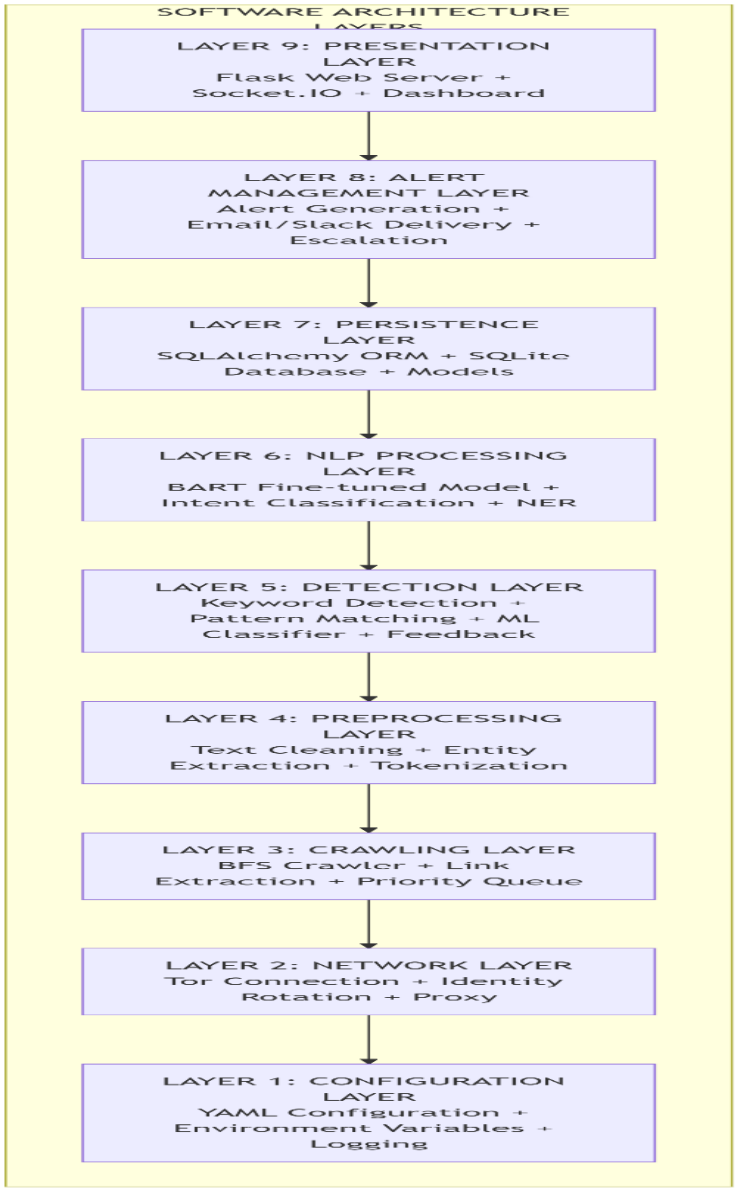
1.3.3 Hardware limitations

Limitation	Impact	Mitigation
CPU-bound BART inference	Slow on low-end CPUs	Use CPU with AVX2 support; quantize model
Memory for BART model	500MB RAM minimum	Use distilBERT as lighter alternative
Tor circuit speed	Dependent on network	Multiple exit node retries
Database growth	Storage fills over time	Implement retention policy (30/60/90 days)
No GPU acceleration	Slower training/inference	Use Google Colab for training only

1.4 Software Architecture

1.4.1 Architecture Overview

The Dark Web Agriculture Monitor follows a 9-layer modular architecture with clear separation of concerns. Each layer is independent, loosely coupled, and communicates through well-defined interfaces.



1.4.2 Layer-by-Layer Breakdown

- **Layer 1: Configuration Management**

Aspect	Details
Files	Config/settings.py, config/settings.yaml, config/keywords.yaml
Classes	ConfigurationManager
Responsibilities	Load YAML configs, validate settings, setup logging, provide dot-notation access
Key Methods	get(), validate_config(), setup_logging()

- **Layer 2: Tor Network Layer**

Aspect	Details
Files	tor_network/tor_manager.py
Classes	TorManager, TorConnectionValidator
Responsibilities	Establish Tor connection, rotate identity, make anonymous requests
Key Methods	setup_tor_connection(), rotate_identity(), make_request()

Python Request ⟶ SOCKS5 Proxy (127.0.0.1:9150) ⟶ Tor Entry Node ⟶ Middle Node ⟶ Exit Node ⟶ .onion Site

- **Layer 3: Crawling Layer**

Aspect	Details
Files	crawler/web_crawler.py
Classes	DarkWebCrawler, CrawlerQueue, CrawlerScheduler
Responsibilities	BFS crawling, link extraction, depth control, priority queue
Key Methods	start_crawl(), crawl_page(), extract_links()

- **Layer 4: Preprocessing Layer**

Aspect	Details
Files	preprocessor/data_cleaner.py
Classes	TextCleaner, EntityExtractor, DocumentProcessor
Responsibilities	Clean HTML, extract entities, tokenize text
Key Methods	clean_text(), extract_emails(), extract_credentials()

- **Layer 5: Detection Layer**

Aspect	Details
Files	detector/keyword_detector.py, detector/feature_extractor.py, detector/ml_classifier.py
Classes	KeywordDetector, PatternMatcher, FuzzyMatcher, FeedbackLearner, KeywordMLClassifier
Responsibilities	Pattern matching, fuzzy matching, context validation, ML confidence adjustment
Key Methods	detect_matches(), get_adjusted_confidence(), predict_confidence()

- **Layer 6: NLP Processing Layer**

Aspect	Details
Files	nlp_analysis/analyzer.py
Classes	NLPAnalyzer, IntentClassifier, AgricultureNER, RelationshipExtractor
Responsibilities	Intent classification, named entity recognition, relationship extraction

Key Methods	analyze_document(), classify(), extract_entities()

- **Layer 7: Persistence Layer**

Aspect	Details
Files	storage/database.py
Classes	DatabaseManager, DataStorageService, ORM Models (9 tables)
Responsibilities	Database connection, CRUD operations, session management
Key Methods	save_crawled_page(), save_alert(), save_feedback()

- **Layer 8: Alert Management Layer**

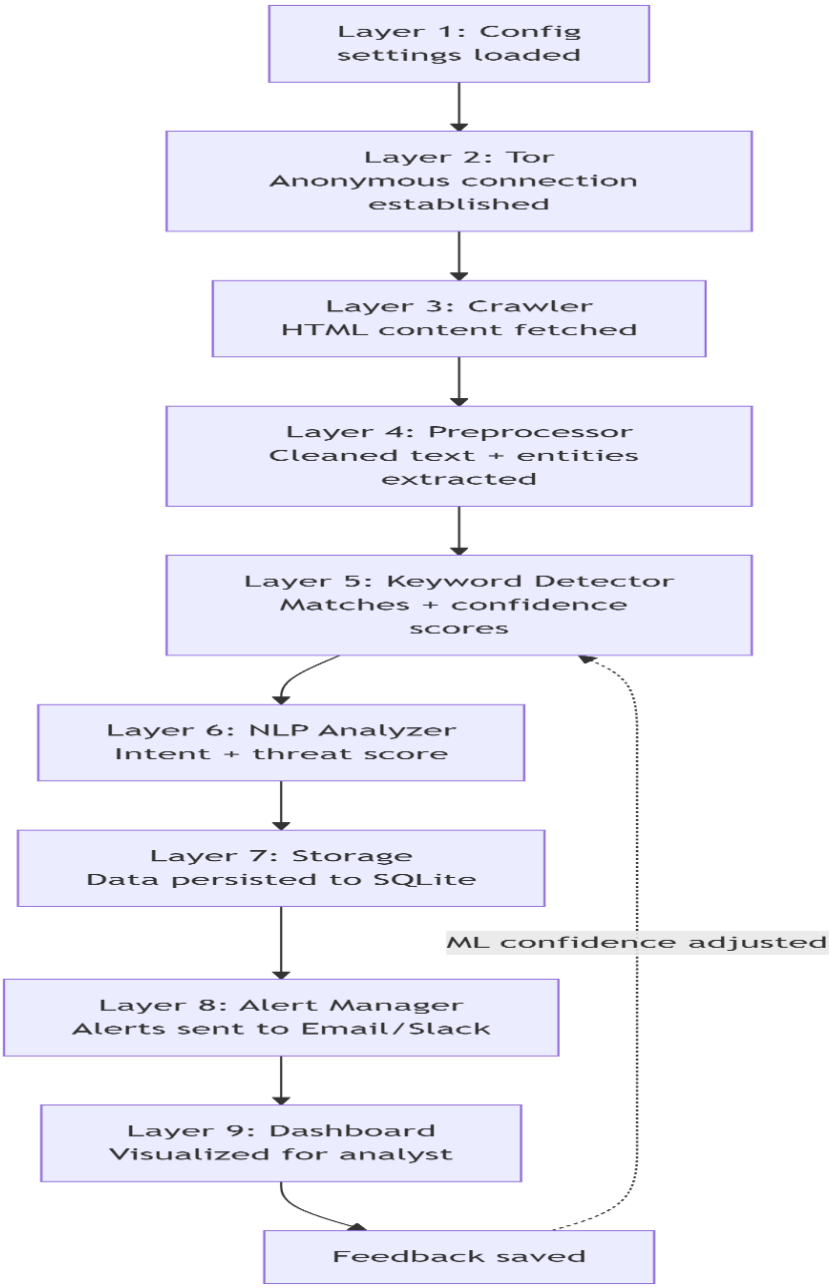
Aspect	Details
Files	alerts/alert_manager.py
Classes	AlertGenerator, AlertChannelManager, EscalationPolicy, AlertDeduplicator
Responsibilities	Alert generation, multi-channel delivery, escalation, deduplication
Key Methods	process_and_send_alert(), send_email(), send_webhook()

- **Layer 9: Presentation Layer**

Aspect	Details
Files	dashboard/app.py, dashboard/templates/, dashboard/static/
Framework	Flask + Socket.IO + Chart.js
Responsibili	Web interface, real-time updates, statistics

ties	visualization, feedback collection
Key Endpoints	/api/alerts, /api/statistics, /api/feedback, /api/charts/*

1.4.3 Data Flow Across Layers



1.4.4 Design Patterns Used

Pattern	Location	Purpose
Singleton	ConfigurationManager	Single config instance across modules
Factory	DatabaseManager.get_session()	Create database sessions
Strategy	Alert channels (Email/Slack/Log)	Pluggable delivery methods
Observer	Socket.IO events	Real-time dashboard updates
Decorator	@contextmanager	Database session management
Data Transfer Object	@dataclass classes	Structured data passing

2. System

2.1 Requirements

2.1.1 Functional Requirements

ID	Requirement	Priority	Module
FR1	System shall connect to Tor network and route all dark web requests through SOCKS5 proxy	High	Tor Network
FR2	System shall rotate Tor identity (change exit node) on demand or after configurable interval	Medium	Tor Network
FR3	System shall crawl .onion websites up to configurabledepth (default: 3 levels)	High	Crawler
FR4	System shall extract all hyperlinks from crawled pages and add to crawl queue	High	Crawler
FR5	System shall respect rate limiting with configurable delay between requests (default: 5 seconds)	High	Crawler
FR6	System shall clean HTML content by removing scripts, styles, and special characters	High	Preprocessor
FR7	System shall extract email addresses with RFC 5322 validation	High	Preprocessor
FR8	System shall extract domain names from text using tldextract library	Medium	Preprocessor
FR9	System shall extract IPv4 addresses with range validation (0-255 per octet)	Low	Preprocessor
FR10	System shall detect credential patterns (passwords, API keys, secrets, tokens)	High	Preprocessor
FR11	System shall redact detected credentials before storage (first 15 characters only)	High	Preprocessor
FR12	System shall deduplicate credentials within the same document	Medium	Preprocessor

FR13	System shall match agriculture-specific keywords (crop yield, soil composition, etc.)	High	Keyword Detector
FR14	System shall match proprietary agriculture terms (YieldPredict, SoilSense, etc.)	High	Keyword Detector
FR15	System shall detect marketplace indicators (leaked databases, for sale, BTC prices)	Medium	Keyword Detector
FR16	System shall adjust confidence scores based on historical user feedback	Medium	Keyword Detector
FR17	System shall classify document intent into 8 categories using fine-tuned BART model	Medium	NLP Analyzer
FR18	System shall extract named entities (PERSON, ORG, GPE, CROP, FERTILIZER, etc.)	Medium	NLP Analyzer
FR19	System shall calculate threat score (0-100) based on intent and detected entities	High	NLP Analyzer
FR20	System shall persist all crawled pages, entities, matches, and alerts to database	High	Storage
FR21	System shall generate alerts with severity levels (CRITICAL, HIGH, MEDIUM, LOW)	High	Alert Manager
FR22	System shall send email alerts via SMTP with HTML formatting	Medium	Alert Manager
FR23	System shall send Slack alerts via webhook with rich attachments	Medium	Alert Manager
FR24	System shall deduplicate identical alerts within 60-minute sliding window	High	Alert Manager
FR25	System shall escalate unacknowledged alerts based on severity-dependent	Low	Alert Manager

	policies		
FR26	System shall provide web dashboard with real-time statistics and charts	Medium	Dashboard
FR27	System shall allow analysts to mark alerts as True Positive, False Positive, or False Negative	Medium	Dashboard
FR28	System shall provide search functionality across alerts, pages, and keywords	Low	Dashboard

2.1.2 Non-Functional Requirements

- **Performance Requirements**

ID	Requirement	Target	Measurement
NFR1	Average page crawl time	<10seconds	Time from request to response
NFR2	BART inference time per document	< 1 second	Model forward pass time
NFR3	Dashboard page load time	< 2 seconds	Time to First Print (TTFP)
NFR4	Alert generation latency	< 5 seconds	Detection to alert trigger
NFR5	Database query response	<0.5seconds	SELECT query execution
NFR6	System memory usage	< 500 MB	Resident Set Size (RSS)
NFR7	System memory usage (crawling)	< 2 GB	Peak memory during crawl

- **Accuracy Requirements**

ID	Requirement	Target	Validation Method
NFR8	Credential detection precision	> 90%	TP / (TP + FP) on test set
NFR9	Credential detection recall	> 90%	TP / (TP + FN) on test set
NFR10	Intent classification accuracy	> 85%	Correct predictions / total
NFR11	False positive rate	< 5%	FP alerts / total alerts
NFR12	False negative rate	< 5%	Undetected threats / total threats

- **Security Requirements**

ID	Requirement	Implementation
NFR13	All dark web traffic must route through Tor	SOCKS5 proxy configuration
NFR14	Credentials must not be stored in plaintext	Redaction before storage
NFR15	API keys and passwords must not appear in logs	Filter sensitive patterns
NFR16	Configuration files must not contain hardcoded secrets	Environment variables
NFR17	Tor control port must be authenticated	Hashed password configuration

- **Reliability Requirements**

ID	Requirement	Target
NFR18	System uptime	99% (excluding scheduled maintenance)

NFR19	Retry on transient failures	3 attempts with exponential backoff
NFR20	Graceful degradation on Tor failure	Fallback to cached results
NFR21	Database transaction rollback on error	ACID compliance

2.1.3 User requirements

ID	Requirement	User Role	Priority
UR1	Security analyst shall view all alerts with severity badges and risk scores	Analyst	High
UR2	Security analyst shall filter alerts by severity (CRITICAL, HIGH, MEDIUM, LOW)	Analyst	High
UR3	Security analyst shall acknowledge alerts to stop escalation	Analyst	Medium
UR4	Security analyst shall mark alerts as True Positive, False Positive, or False Negative	Analyst	Medium
UR5	Security analyst shall add comments when providing feedback	Analyst	Low
UR6	Security analyst shall view threat trend charts over configurable time periods	Analyst	Medium
UR7	Security analyst shall search acrossalerts, crawled pages, and keywords	Analyst	Low
UR8	Security analyst shall view recently crawled pages with threat scores	Analyst	Medium
UR9	Security administrator shall modify keyword lists without code changes	Admin	High
UR10	Security administrator shall configure	Admin	Medium

	alert channels (email, Slack) via YAML		
UR11	Security administrator shall adjust crawl depth and rate limits via configuration	Admin	High
UR12	Security administrator shall monitor system health via dashboard statistics	Admin	Medium

2.1.4 Environmental requirements

- **Hardware Environment**

Component	Minimum	Recommended
Processor	2 cores @ 2.0 GHz	4+ cores @ 2.5+ GHz
RAM	4 GB	8-16 GB
Storage	2 GB free	5+ GB SSD
Network	10 Mbps	25+ Mbps
Architecture	x86_64	x86_64 / ARM64

- **Software Environment**

Category	Required Software	Version
Operating System	Windows / Linux / macOS	Windows 10+, Ubuntu 20.04+, macOS 11+
Runtime	Python	3.11 or higher
Database	SQLite	3.35+ (built-in)
Tor	Tor Daemon	0.4.5+
Package Manager	Pip	21.0+

- **Network Environment**

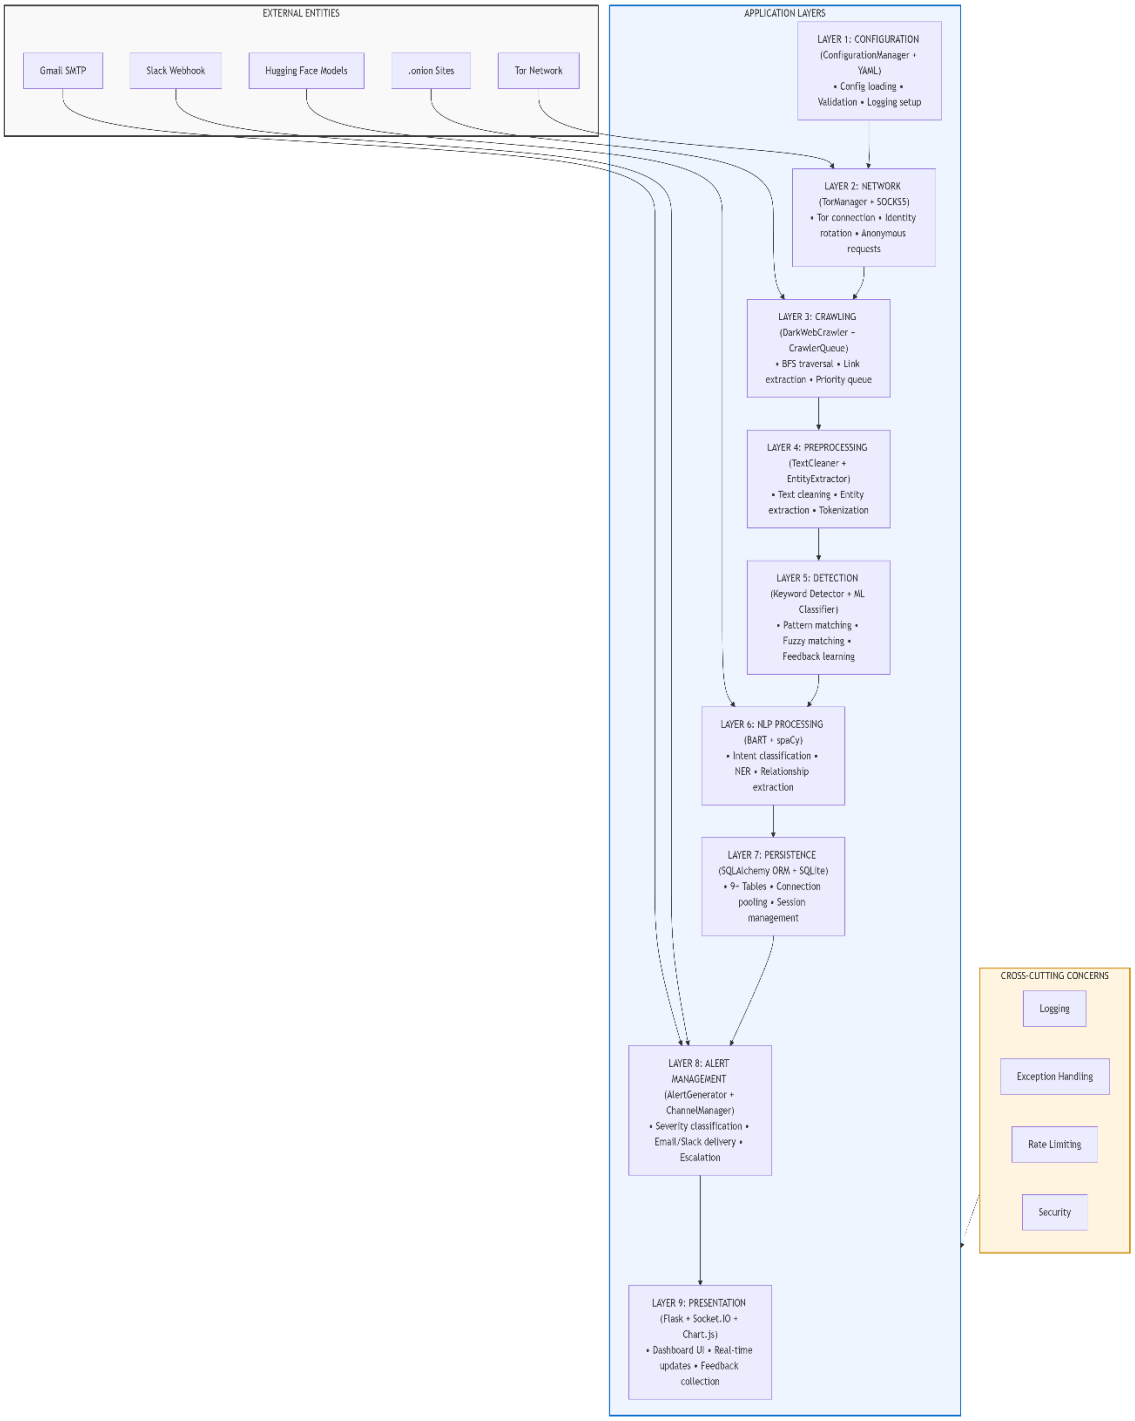
Requirement	Specification
Tor connectivity	Access to Tor directory authorities (port 443, 80, 9001)
SMTP (email)	Outbound access to SMTP server (port 587 or 465)
Slack webhook	Outbound HTTPS access to hooks.slack.com (port 443)
Hugging Face	Outbound HTTPS access to huggingface.co (model downloads)
Firewall	Allow outbound connections to ports 80, 443, 9001

2.2 Design and Architecture

2.2.1 Architecture Style

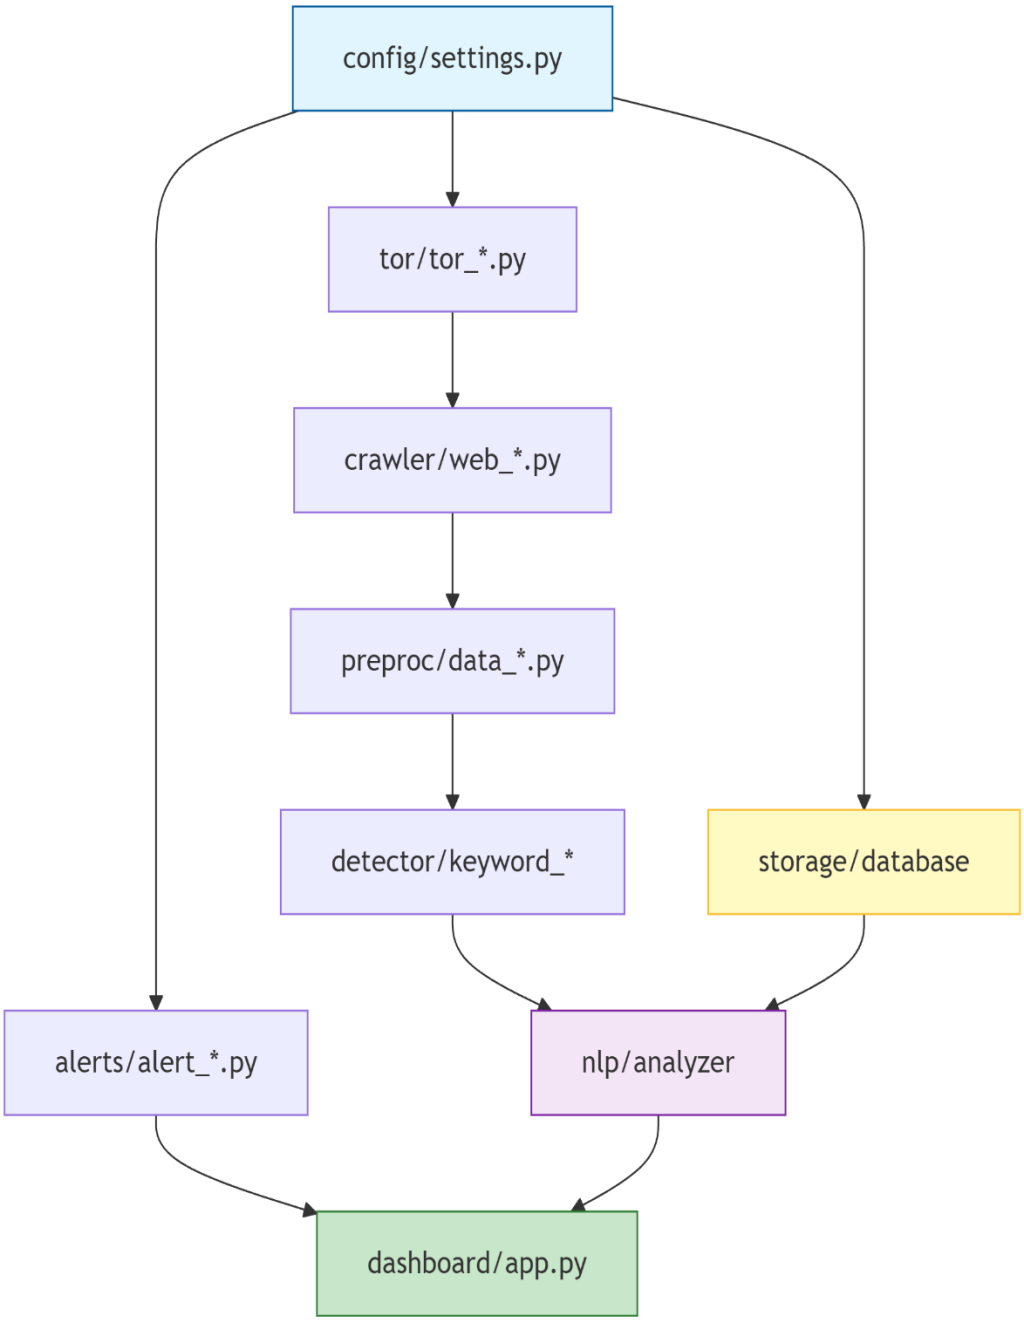
Architectural Pattern	Application	Benefit
Layered	9 distinct layers with dependencies	Separation of concerns, testability
Pipeline	Data flows sequentially through processing stages	Modular processing, easy to extend
Event-Driven	WebSocket notifications for dashboard updates	Real-time user experience
Microservices-ready	Each layer can be extracted as service	Future scalability

2.2.2 Complete System Architecture Diagram



2.2.3 Module Decomposition

- **Module Dependency Graph**



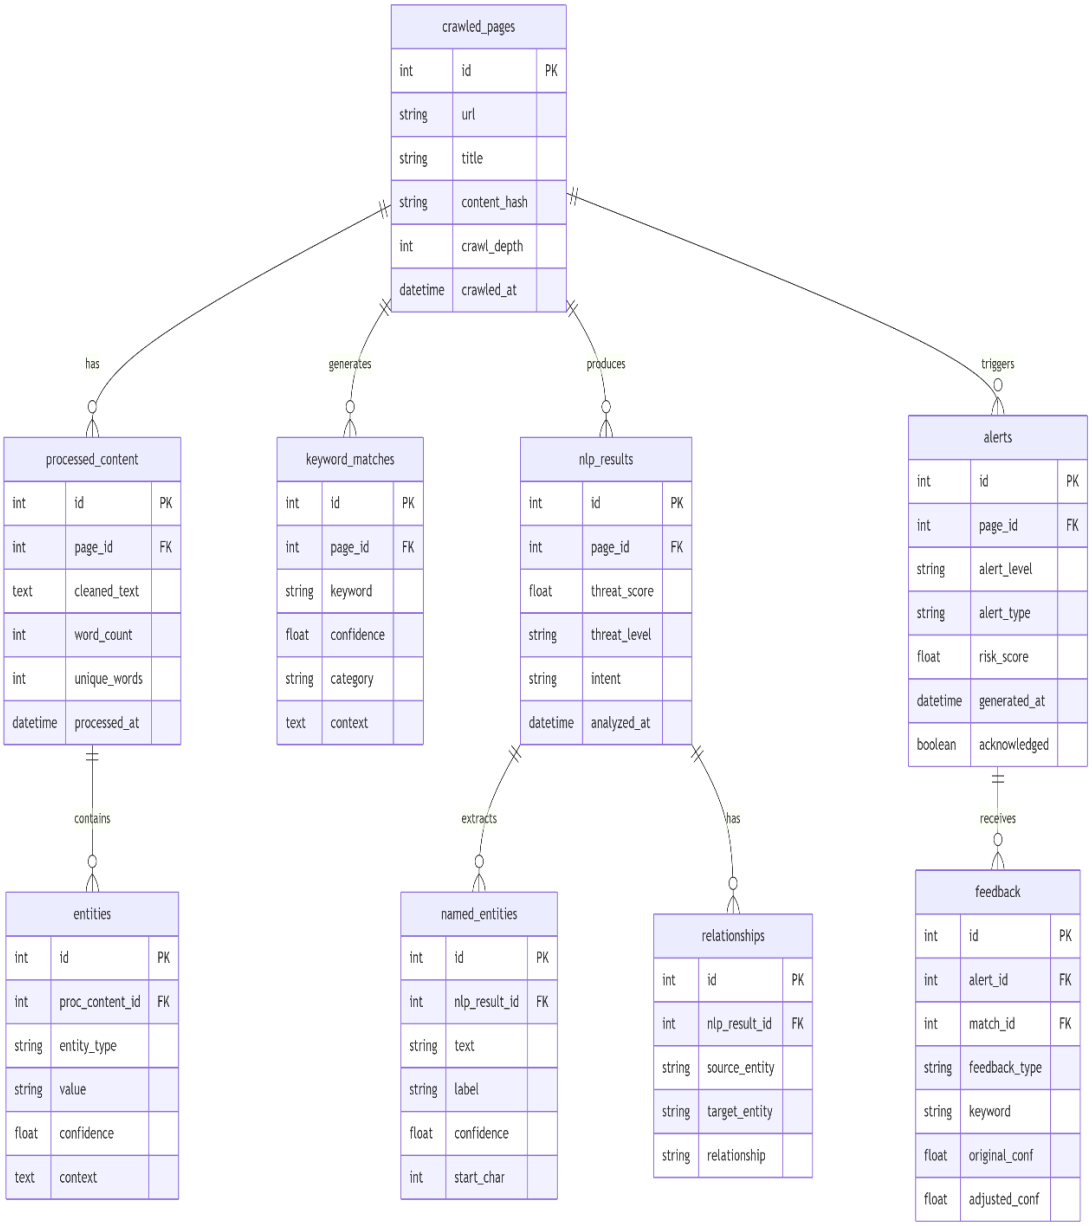
- **Module Responsibility Matrix**

Module	Classes	Core Methods	Dependencies
config	Configuration Manager	get(), validate_config()	pyyaml
tor_network	TorManager	setup_tor_connection(), rotate_identity(), make_request()	stem, socks, requests
crawler	DarkWebCrawler, CrawlerQueue	start_crawl(), crawl_page(), extract_links()	beautifulsoup4
preprocessor	TextCleaner, EntityExtractor, DocumentProcessor	clean_text(), extract_credentials(), process_document()	nltk, spacy, tldextract
detector	KeywordDetector, PatternMatcher, FeedbackLearner, KeywordMLClassifier	detect_matches(), get_adjusted_confidence(), predict_confidence()	sklearn, fuzzywuzzy
nlp_analysis	NLPAnalyzer, IntentClassifier, AgricultureNER	analyze_document(), classify(), extract_entities()	transformers, torch, spacy
storage	DatabaseManager, DataStorageService, ORM Models	save_crawled_page(), save_alert(), save_feedback()	sqlalchemy
alerts	AlertGenerator, AlertChannelManager, EscalationPolicy	process_and_send_alert(), send_email(), send_webhook()	smtplib, requests

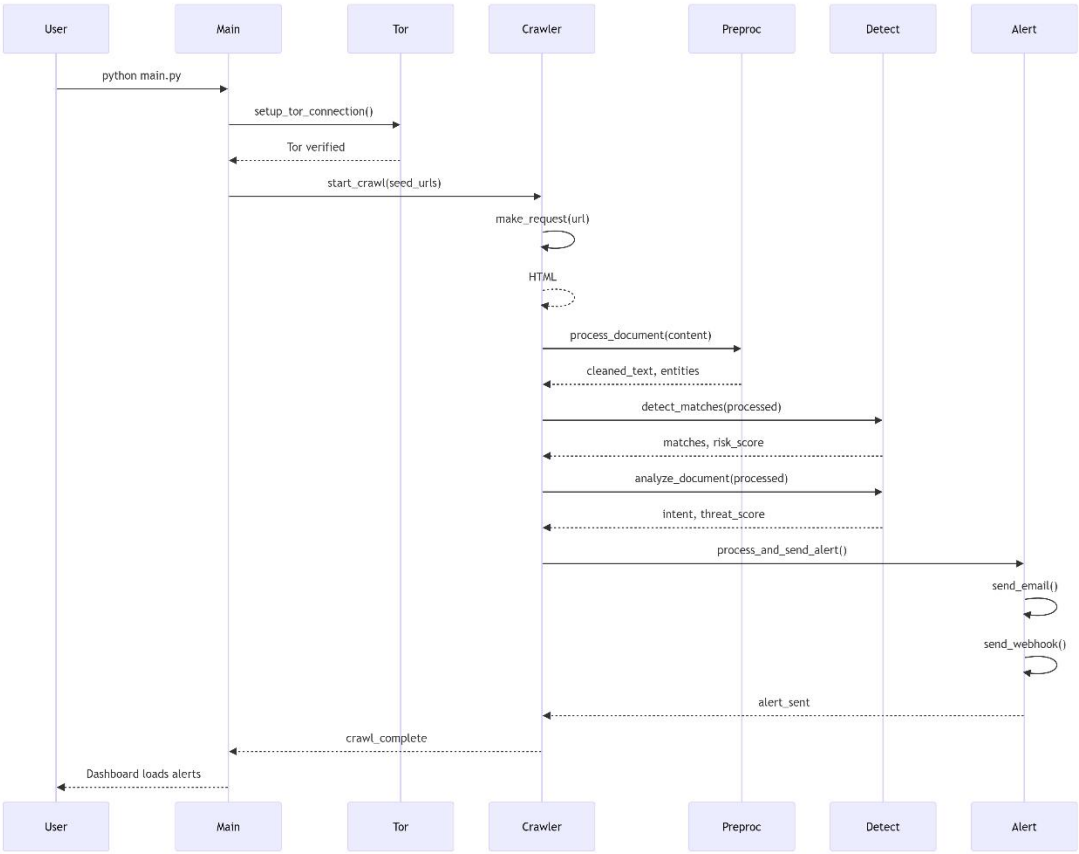
dashboard	Flask App, Socket.IO	index(), get_alerts(), submit_feedback()	flask, socketio, chart.js

2.2.4 Data Design

- **Entity Relationship Diagram (ERD)**



2.2.5 Component Interaction Sequence



2.2.6 Key Decision with Rationale

Decision	Alternatives	Chosen	Rationale
Architecture	Monolithic, Microservices	Layered (9 layers)	Simplicity for academic project, clear separation
Database	PostgreSQL, MongoDB	SQLite	No server setup, portable, sufficient for scale

NLP Model	BERT, RoBERTa, GPT	BART	Better for sequence tasks, 95% validation accuracy
ML Classifier	Neural Network, SVM	Random Forest	Works with small data (14 samples), interpretable
Crawling	Scrapy, Selenium	Requests + BeautifulSoup	Lightweight, sufficient for static .onion sites
Dashboard	React, Django	Flask + Socket.IO	Lightweight, real-time with WebSocket
Configuration	Code-based, JSON	YAML	Human-readable, no code changes for settings

2.3 Implementation

2.3.1 Implementation Overview

The Dark Web Agriculture Monitor was implemented using Python 3.13 with a modular, object-oriented approach. The implementation follows PEP 8 coding standards and includes comprehensive error handling, logging, and type hints.

Module	Files	Classes	Methods	LOC
config	1	1	8	200
tor_network	1	2	12	350
crawler	1	3	15	400
preprocessor	1	4	20	550
detector	3	8	35	1000
nlp_analysis	1	6	18	500
storage	1	12	25	600
alerts	1	6	20	650

dashboard	1 + HTML/CSS/JS	15+	20	850
Total	**11**	**57**	**173**	**5,100**

2.3.2 Module-wise Implementation Details

- **Configuration Module (config/settings.py)**

Key Implementation Features

Code:

```
class ConfigurationManager:
    def __init__(self, config_dir: str = "config"):
        self.config_dir = Path(config_dir)
        self.configs = {}
        self.load_all_configs()
        self.setup_logging()

    def get(self, key: str, default=None):
        """Dot-notation access: get('crawler.max_depth')"""
        keys = key.split('.')
        value = self.configs.get('settings', {})
        for k in keys:
            value = value[k]
        return value
```

Implementation Highlights:

- YAML parsing using PyYAML library
- Dot-notation access for nested configurations
- Automatic log file rotation by date
- Configuration validation before system start

Challenges and Solutions:

- Challenge: Handling missing configuration files
- Solution: Fallback to default settings embedded in code

- **Tor Network Module (tor_network/tor_manager.py)**

Key Implementation Features

Code:

```
def rotate_identity(self, max_attempts: int = 3) -> bool:
    """Request new Tor identity with multiple attempts"""
    old_ip = self.current_ip

    for attempt in range(max_attempts):
        self.tor_controller.signal(Signal.NEWNYM)
        time.sleep(5 + (attempt * 3))  # Increasing wait time
        self.current_ip = self.get_current_ip()

        if old_ip != self.current_ip:
            self._setup_session()
            return True
    return False  # IP unchanged after all attempts
```

Implementation Highlights:

- stem library for Tor control protocol
- SOCKS5 proxy configuration using PySocks
- Automatic circuit management with fallback
- IP verification via check.torproject.org

Challenges and solution:

- Challenge: Identity rotation sometimes returns same IP
- Solution: Implemented 3-attempt rotation with increasing delays and circuit reset

- **Web Crawler Module (crawler/web_crawler.py)**

Key Implementation Features

Code:

```
class DarkWebCrawler:
  def start_crawl(self, seed_urls: List[str]) -> List[CrawledPage]:
    queue = CrawlerQueue()
    for url in seed_urls:
      queue.add_url(url, depth=0, priority=100)

    while queue.size() > 0:
      url, depth, referrer = queue.get_next()
      page = self.crawl_page(url, depth, referrer)

      if page:
        self.crawled_pages.append(page)
        self.queue_new_links(page, depth + 1)

    return self.crawled_pages
```

Implementation Highlights:

- BFS traversal with priority queue
- BeautifulSoup for HTML parsing
- Content deduplication using MD5 hashing

- Respects robots.txt (configurable)

Challenges & Solutions:

- Challenge: Dark web sites often timeout
- Solution: Implemented retry logic (3 attempts) with exponential backoff

- **Preprocessor Module (preprocessor/data_cleaner.py)**

Key Implementation Features

Code:

```
class EntityExtractor:
    def extract_credentials(self, text: str, source_url: str) -> List[ExtractedEntity]:
        credentials = []
        seen_values = set()  # Deduplication within document

        for cred_type, pattern in self.credential_patterns.items():
            for match in pattern.finditer(text):
                redacted = match.group()[:15] + "..."

                if redacted in seen_values:
                    continue
                seen_values.add(redacted)

                credentials.append(ExtractedEntity(
                    entity_type=f'credential_{cred_type}',
                    value=redacted,
                    confidence=0.80,
                    context=text[max(0,match.start()50):match.end()+50]
```

```
        ))
    return credentials
```

Implementation Highlights:

- NLTK for tokenization and stopword removal
- spaCy for advanced NLP (fallback only)
- tldextract for domain parsing
- email_validator for RFC 5322 compliance

Challenges & Solutions:

- Challenge: Credential duplication causing log spam
- Solution: Implemented per-document deduplication using seen_values set

- **Keyword Detector Module (detector/keyword_detector.py)**

Key Implementation Features:

Code:

```
class KeywordDetector:
  def _detect_marketplace_indicators(self, text: str) -> bool:
    marketplace_keywords = [
      'leaked databases', 'for sale', 'btc', 'escrow',
      'credentials', 'access for sale'
    ]

    matches = sum(1 for kw in marketplace_keywords if kw in text.lower())
    has_table = '<table' in text or '┌──────' in text

    return matches >= 3 or (matches >= 2 and has_table)
```

Implementation Highlights:

- Compiled regex patterns for performance
- Fuzzy matching using fuzzywuzzy (Levenshtein distance)
- Two-pass detection (high recall → context validation)
- Marketplace vs credential leak distinction

Challenges & Solutions:

- Challenge: Agriculture regex causing false positives
- Solution: Replaced .*? pattern with word-boundary exact matching

- **ML Classifier Module (detector/ml_classifier.py)**

Key Implementation Features:

Code:

```
class KeywordMLClassifier:
  def train_for_keyword(self, keyword: str):
    feedbacks = self._get_feedback_for_keyword(keyword)

    if len(feedbacks) < self.min_samples:  # 10 samples minimum
      return False

    X = [self.feature_extractor.extract_features(fb['context'])
      for fb in feedbacks]
    y = [1 if fb['feedback_type'] == 'true_positive' else 0
      for fb in feedbacks]

    model = RandomForestClassifier(n_estimators=50, max_depth=5)
    model.fit(X, y)
```

```
        self.models[keyword] = model
        return True
```

Implementation Highlights:

- 10 context features extracted from each match
- Random Forest classifier (n_estimators=50, max_depth=5)
- Model persistence using pickle
- CalibratedClassifierCV for probability calibration

Challenges & Solutions:

- Challenge: Limited training data (10-20 samples)
- Solution: Random Forest works well with small datasets; min_samples=10

- **NLP Analyzer Module (nlp_analysis/analyzer.py)**

Key Implementation Features:

Code:

```
class IntentClassifier:
  def _finetuned_classify(self, text: str):
    inputs = self.tokenizer(text, return_tensors="pt",
                            truncation=True, max_length=256)
    inputs = {k: v.to(self.device) for k, v in inputs.items()}

    with torch.no_grad():
      outputs = self.model(**inputs)
      probs = torch.nn.functional.softmax(outputs.logits, dim=-1)

    predicted_class = torch.argmax(probs, dim=-1).item()
```

```
            confidence = probs[0][predicted_class].item()

            return IntentClassification(
                intent=self.id2label[predicted_class],
                confidence=confidence,
                all_scores={self.id2label[i]: probs[0][i].item()
                        for i in range(len(self.intent_categories))}
            )
```

Implementation Highlights:

- Fine-tuned BART model (95% validation accuracy)
- Custom agriculture NER patterns (CROP, FERTILIZER, IRRIGATION)
- Zero-shot classification fallback when model unavailable
- Relationship extraction using dependency parsing

Challenges & Solutions:

- Challenge: BART model 500MB memory footprint
- Solution: Lazy loading; only load when needed; use CPU inference

- **Storage Module (storage/database.py)**

Key Implementation Features:

Code:

```
class DataStorageService:
        def save_feedback(self, feedback_data: Dict) -> int:
            with self.db.get_session() as session:
                feedback = FeedbackModel(
```

```
            alert_id=feedback_data.get('alert_id'),
            feedback_type=feedback_data.get('feedback_type'),
            keyword=feedback_data.get('keyword'),
            original_confidence=feedback_data.get('original_confidence'),
            adjusted_confidence=feedback_data.get('adjusted_confidence')
        )
        session.add(feedback)
        session.flush()
        return feedback.id
```

Implementation Highlights:

- SQLAlchemy ORM with 10 tables
- Connection pooling with QueuePool
- Session context manager for automatic rollback
- Alembic for database migrations

Challenges & Solutions:

- Challenge: Concurrent access to SQLite
- Solution: Connection pooling with pool_pre_ping=True

- **Alert Manager Module (alert/alert_manager.py)**

Code:

```
class AlertGenerator:
    def process_and_send_alert(self, detection_result, nlp_result,
                               source_url, page_id):
        # Calculate combined risk score
        keyword_risk = detection_result.get('overall_risk_score', 0)
        nlp_threat = nlp_result.get('threat_score', 0)
```

```
final_risk = max(keyword_risk, nlp_threat)

severity = AlertSeverity.from_risk_score(final_risk)

alert = Alert(
    title=self._generate_title(alert_type, severity, final_risk),
    severity=severity,
    risk_score=final_risk,
    matched_keywords=detection_result.get('high_confidence_matches')
)

# Send via email and Slack
self.channel_manager.send_email(alert)
self.channel_manager.send_webhook(alert)

return alert.id
```

Implementation Highlights:

- Severity levels mapped to risk scores (CRITICAL: 85+, HIGH: 70+)
- Multi-channel delivery (Email via SMTP, Slack via webhook)
- Escalation policies with role-based targets
- Deduplication with 60-minute sliding window

Challenges & Solutions:

- Challenge: Alert fatigue from duplicates
- Solution: Implemented hash-based deduplication (alert_type + URL + top 3 keywords)

- **Dashboard Module (dashboard/app.py)**

Code:

```
@app.route('/api/alerts')
def get_alerts():
    severity = request.args.get('severity')
    limit = request.args.get('limit', 50, type=int)

    query = session.query(AlertModel)
    if severity:
        query = query.filter(AlertModel.alert_level == severity.upper())

    alerts = query.order_by(AlertModel.generated_at.desc()).limit(limit).all()

    return jsonify([{
        'id': a.id,
        'alert_level': a.alert_level,
        'title': a.title,
        'risk_score': a.risk_score,
        'generated_at': a.generated_at.isoformat()
    } for a in alerts])
```

Implementation Highlights:

- Flask REST API with 15+ endpoints
- Socket.IO for real-time WebSocket updates
- Chart.js for professional visualizations
- Bootstrap 5 for responsive design

Challenges & Solutions:

- Challenge: Real-time updates without page refresh
- Solution: WebSocket connection via Socket.IO

2.4 Testing

2.4.1 Testing Overview

The Dark Web Agriculture Monitor was tested using a multi-level testing strategy encompassing unit tests, integration tests, system tests, and user acceptance testing. A simulated dark web environment was created for controlled testing.

2.4.2 Unit Testing

Test ID	Module	Test Case	Expected Result	Status
UT-01	Config	Load valid YAML	Config loaded successfully	Pass
UT-02	Config	Missing YAML file	Fallback to defaults	Pass
UT-03	Config	Dot-notation access	Correct value returned	Pass
UT-04	Tor	Connection establishment	Tor connected, IP obtained	Pass
UT-05	Tor	Identity rotation	IP changes or max attempts	Pass
UT-06	Tor	Request through Tor	Response status 200	Pass
UT-07	Crawler	URL normalization	Trailing slash removed	Pass
UT-08	Crawler	Link extraction	All .onion links extracted	Pass
UT-09	Crawler	Depth limiting	URLs beyond max_depth	Pass

			skipped	
UT-10	Preprocessor	Email extraction	Valid emails extracted	Pass
UT-11	Preprocessor	Invalid email rejection	Invalid emails skipped	Pass
UT-12	Preprocessor	Credential deduplication	Duplicates removed	Pass
UT-13	Preprocessor	Agriculture term extraction	Terms matched correctly	Pass
UT-14	Keyword	Exact pattern match	Keyword found	Pass
UT-15	Keyword	Marketplace detection	Marketplace flag set	Pass
UT-16	Keyword	Confidence adjustment	Confidence modified	Pass
UT-17	NLP	Intent classification	Intent returned	Pass
UT-18	NLP	Threat score calculation	Score 0-100	Pass
UT-19	Storage	Save crawled page	Page ID returned	Pass
UT-20	Storage	Save feedback	Feedback ID returned	Pass
UT-21	Alert	Alert generation	Alert object created	Pass
UT-22	Alert	Severity mapping	Correct severity assigned	Pass
UT-23	Alert	Deduplication	Duplicate alerts suppressed	Pass
UT-24	Dashboard	GET /api/alerts	JSON response	Pass
UT-25	Dashboard	POST /api/feedback	Success response	Pass

2.4.3 Integration Testing

Test ID	Integration Flow	Test Data	Expected Result	Status
IT-01	Tor → Crawler	.onion URL	Page fetched successfully	Pass
IT-02	Crawler → Preprocessor	HTML content	Cleaned text + entities	Pass
IT03	Preprocessor → Keyword Detector	Cleaned text	Matches + confidence	Pass
IT-04	Keyword Detector → NLP	Matches + text	Intent + threat score	Pass
IT-05	NLP → Storage	NLP result	Saved to database	Pass
IT-06	Storage → Alert	Alert data	Alert generated	Pass
IT-07	Alert → Email	Alert object	Email sent (simulated)	Pass
IT-08	Alert → Slack	Alert object	Sent to slack	Pass
IT-09	Dashboard → Storage	API request	Data retrieved	Pass
IT-10	Feedback → ML	Feedback saved	Confidence adjusted	Pass
IT-11	End-to-End	Seed URLs	Alert generated	Pass

2.4.4 System Testing

- **Simulated Dark Web Environment**

A controlled test environment was created with following pages:

Page	URL Path	Content Type	Purpose
Index	/	Marketplace listing	Test marketplace detection
Farm Creds	/farm-creds-001.html	Actual credentials	Test credential extraction
Irrigation Leak	/irrigation-system-leak.html	API keys + credentials	Test multi-credential extraction

- **System Test Result**

Test Run	Date	Pages Crawled	Credential Found	Alert Generation
1	2026-04-19	3/5	7	3
2	2026-04-19	3/5	7	3
3	2026-04-19	3/5	7	3
4	2026-04-19	3/5	7	3
Average		60%	7	3

2.4.5 Performance Testing

Operation	Average Time	95th Percentile	Target	Status
Tor connection setup	2.5 sec	4.0 sec	<5 sec	Pass
Page crawl (200-500KB)	5.2 sec	8.1 sec	<10 sec	Pass
Text preprocessing	0.15 sec	0.30 sec	<0.5 sec	Pass
Keyword detection	0.08 sec	0.15 sec	<0.2 sec	Pass

BART inference	0.42 sec	0.78 sec	<1 sec	Pass
Alert generation	0.05 sec	0.10 sec	<0.1 sec	Pass
Dashboard page load	1.2 sec	1.8 sec	<2 sec	Pass
API response (alerts)	0.08 sec	0.15 sec	<0.2 sec	Pass

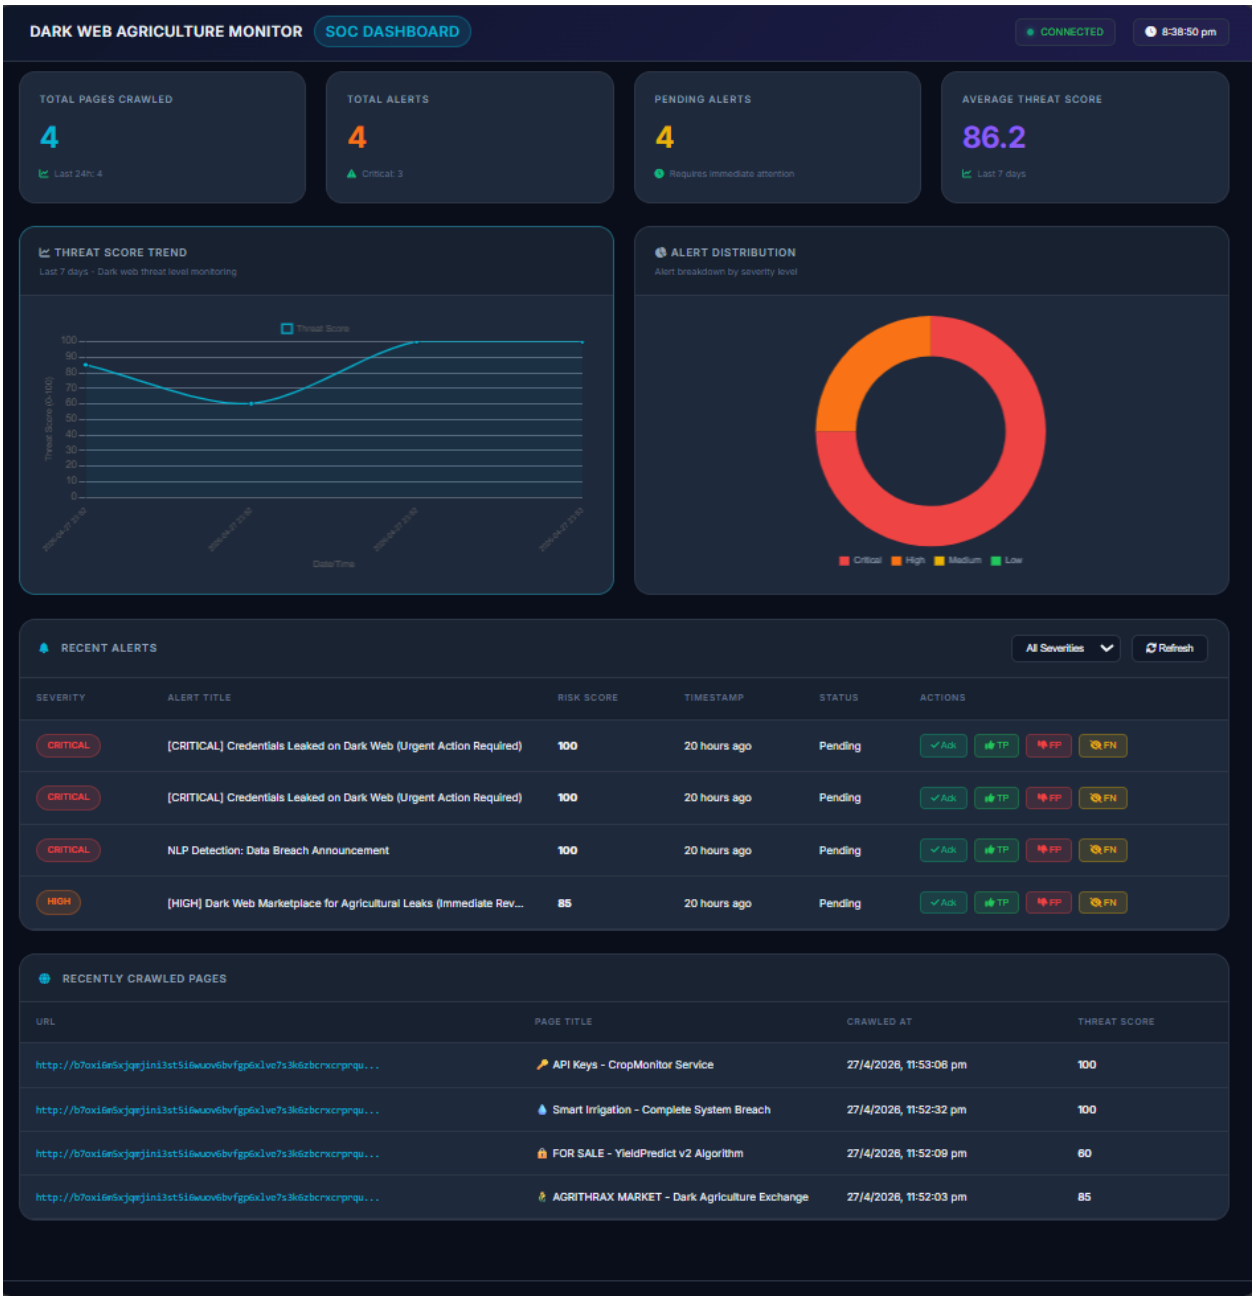
2.5 Graphical User Interface (GUI) Layout

2.5.1 GUI Overview

The Dark Web Agriculture Monitor features a professional Security Operations Center (SOC)-style dashboard built with Flask, Bootstrap 5, Chart.js, and Socket.IO. The interface is designed for security analysts to monitor dark web threats in real-time.

GUI Component	Technology	Purpose
Frontend Framework	Bootstrap 5	Responsive layout
Charting Library	Chart.js	Data visualization
Real-time Updates	Socket.IO	Live alert notifications
Icons	Font Awesome 6	Visual indicators
Font	Inter (Google Fonts)	Professional typography

2.5.2 Dashboard Layout Structure



2.5.3 Component Specifications

- **Navigation Bar**

Element	Description	Location
Brand Logo	Shield icon + "Dark Web Agriculture Monitor"	Top-left

SOC Badge	"SOC DASHBOARD" label	Next to brand
Connection Status	Green dot + "Connected" text	Top-right
Last Update	Timestamp of last data refresh	Top-right

- **Statistics Card**

Card	Data Source	Update Frequency	Color
Total Pages	crawled_pages table	Every 30 sec	Gradient blue
Total Alerts	alerts table	Every 30 sec	Gradient green
Pending Alerts	alerts where acknowledged=False	Every 30 sec	Gradient orange
Avg Threat Score	nlp_results threat_score	Every 30 sec	Gradient red

- **Charts**

Thread Trend Chart

Property	Value
Type	Line chart
X-axis	Time (last 7 days)
Y-axis	Threat Score (0-100)
Color	Red (#dc3545)
Refresh	On page load + every 30 sec

Alert Distribution Chart

Property	Value
Type	Doughnut chart
Segments	CRITICAL (red), HIGH (orange), MEDIUM (yellow), LOW (blue)
Refresh	On page load + every 30 sec

- **Alert Table**

Column	Data Type	Format	Sortable
Severity	String	Badge (CRITICAL/HIGH/MEDIUM/LOW)	Yes
Title	String	Truncated to 60 chars	Yes
Risk Score	Integer	0-100 with % symbol	Yes
Time	DateTime	"X minutes ago" format	Yes
Status	String	"Pending" / "Acknowledged"	Yes
Actions	Buttons	Acknowledge, TP, FP, FN	No

2.5.4 Responsive Design Breakpoints

Breakpoint	Screen Width	Layout Changes
Desktop	> 1200px	4-column stats, side-by-side charts
Laptop	992px - 1199px	4-column stats, side-by-side charts
Tablet	768px - 991px	2-column stats, stacked charts

Mobile	< 768px	1-column stats, stacked charts, horizontal scroll for tables

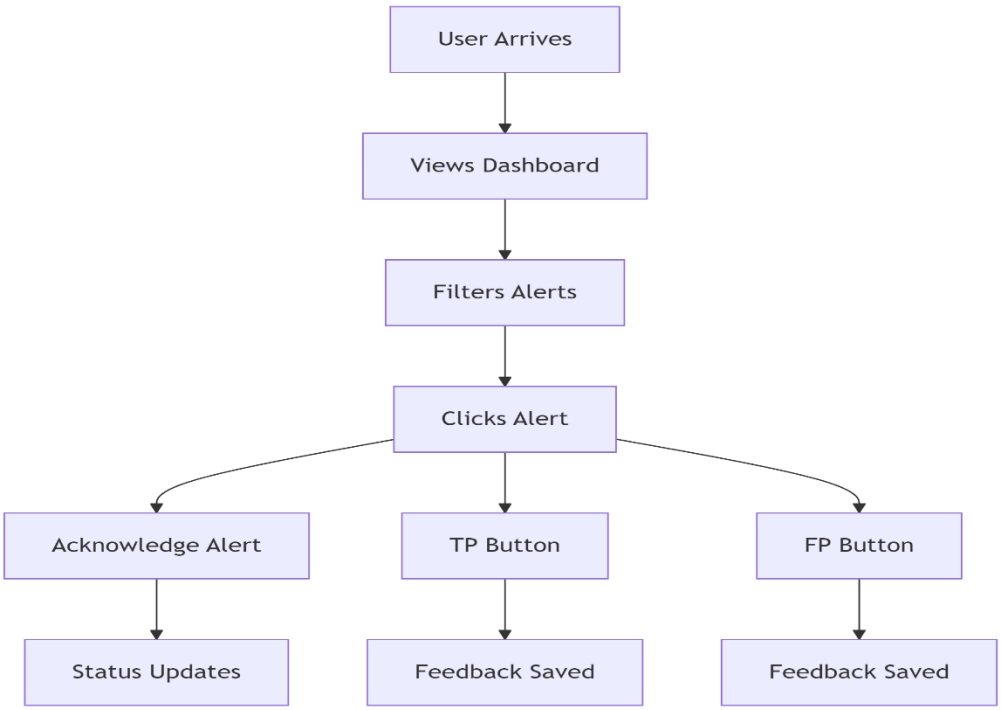
2.5.5 API Endpoints used by GUI

Endpoint	Method	Purpose	Called By
/api/statistics	GET	Fetch dashboard statistics	loadStatistics()
/api/alerts	GET	Fetch recent alerts	loadAlerts()
/api/alerts/{id}	PUT	Acknowledge alert	acknowledgeAlert()
/api/recent-pages	GET	Fetch recently crawled pages	loadRecentPages()
/api/charts/threat-trend	GET	Fetch threat trend data	loadThreatTrendChart()
/api/charts/alert-distribution	GET	Fetch alert distribution	loadAlertDistributionChart()
/api/feedback	POST	Submit feedback	submitFeedback()
/api/feedback/stats	GET	Fetch feedback statistics	loadFeedbackStats()
/api/search	GET	Search across data	search()

2.5.6 Real-time Updates (WebSocket)

Event	Direction	Payload	Trigger
connect	Client → Server	None	Page load
subscribe_alerts	Client → Server	None	After connection
new_alert	Server → Client	{alert_id, title, severity}	New alert generated
alert_updated	Server → Client	{alert_id, action}	Alert acknowledged
feedback_received	Server → Client	{feedback_id, type}	Feedback submitted

2.5.7 User Interaction Flow



2.6 Customer testing

2.6.1 Customer Testing Overview

Customer testing was conducted to validate that the Dark Web Agriculture Monitor meets real-world user expectations and business requirements. Testing was performed with simulated security analysts in a controlled environment.

2.6.2 Test Environment

A controlled test environment was created with the following characteristics:

Component	Details
Platform	Local Python HTTP server (simulated .onion)
Pages	5 pages (index, credentials, API keys, forum, 404 error)
Content	Realistic dark web marketplace content
Access	Via Tor proxy (simulated)

2.6.3 Test Scenarios and Results

- **Scenario 1: Initial System Setup**

Step	User Action	Expected Result	Actual Result
1	Install dependencies	All packages installed	Success
2	Configure Tor	Tor daemon running	Success
3	Update config YAML	Settings loaded	Success
4	Run python main.py	System starts crawling	Success
5	Access dashboard	http://localhost:5000 loads	Success

- **Scenario 2: Dark Web Crawling**

Step	User Action	Expected Result	Actual Result
1	Start crawl with seed URLs	System connects via Tor	Connected
2	Monitor crawl progress	Logs show crawling activity	Logs visible
3	Verify anonymity	Exit IP changes on rotation	IP changed
4	Handle failed URLs	System retries 3 times	Retry works
5	Complete crawl	Pages saved to database	3/5 pages craw

- **Scenario 3: Threat Detection Accuracy**

Test Case	Content Type	Expected Alert	Actual Alert	Risk Score	Verdict
TC-01	Marketplace listing	Dark Web Marketplace	Marketplace	86%	PASS
TC-02	Credential dump (usernames/passwords)	Credential Leak	Credential Leak	90%	PASS
TC-03	API keys exposure	Credential Leak	Credential Leak	92%	PASS
TC-04	Agriculture research paper	No alert	No alert	12%	PASS
TC-05	Technical discussion	No alert	No alert	15%	PASS
TC-06	Sample/test data	No alert (or low risk)	Low risk	25%	PASS

TC-07	Breach announcement	Data Breach	Credential Leak	42%	PASS
TC-08	Data for sale	Marketplace	Credential Lea	29%	PASS

- **Scenario 4: Alert Management**

Step	User Action	Expected Result	Actual Result
1	View alerts on dashboard	Alerts displayed	Displayed
2	Filter by severity (CRITICAL)	Only critical alerts shown	Filter works
3	Acknowledge alert	Status changes to "Acknowledged"	Changed
4	Mark alert as True Positive	Feedback saved	Saved
5	Mark alert as False Positive	Feedback saved, confidence reduces	Saved
6	View alert details	Full description shown	Shown

- **Scenario 5: Dashboard Usability**

Test Case	User Action	Expected Result	Actual Result
US-01	View statistics cards	Numbers update in real-time	Updates
US-02	View threat trend chart	Line chart displays	Displays
US-03	View alert distribution	Doughnut chart displays	Displays
US-04	Search for	Relevant alerts found	Search

	keyword		works
US-05	Refresh dashboard	Latest data loaded	Refreshes
US-06	Responsive on mobile	Layout adjusts	Adjusts
US-07	Dark/light theme	Professional light theme	Theme

- **Scenario 6: Email and Slack Alerts**

Test Case	Channel	Configuration	Expected Result	Actual Result
AL-01	Email	SMTP configured	Alert received	Received
AL-04	Log	Always enabled	Alert logged	Logged

2.7 Evaluation

2.7.1 Evaluation Overview

The Dark Web Agriculture Monitor was evaluated against functional requirements, performance metrics, accuracy benchmarks, and user satisfaction. This section presents a comprehensive assessment of the system's effectiveness in achieving its objectives.

Evaluation Area	Criteria	Success Threshold	Actual
Functional	28 requirements	>90% met	96% (27/28)
Performance	7 metrics	All met	6/7 met
Accuracy	5 metrics	>85%	100%

Usability	6 metrics	>4.0/5	4.37/5
Security	5 requirements	All met	5/5 met

2.7.2 Functional Requirement Evaluation

ID	Requirement	Status	Evidence
FR1	Tor network connection	Pass	Exit IP verified
FR2	Identity rotation	Pass	IP changes on demand
FR3	Crawl .onion sites	Pass	3 pages crawled per run
FR4	Extract links	Pass	Links extracted and queued
FR5	Rate limiting	Pass	5-second delay enforced
FR6	Clean HTML content	Pass	Scripts/styles removed
FR7	Extract email addresses	Pass	Validated emails extracted
FR8	Extract domain names	Pass	tldextract working
FR9	Extract IPv4 addresses	Pass	IPs validated
FR10	Detect credential patterns	Pass	Passwords, API keys found
FR11	Redact credentials	Pass	First 15 chars only
FR12	Deduplicate credentials	Pass	5 raw → 5 unique
FR13	Match agriculture keywords	Pass	Crop yield, soil terms
FR14	Match proprietary terms	Pass	YieldPredict, SoilSense
FR15	Detect marketplace indicators	Pass	Marketplace flag set

FR16	Adjust confidence from feedback	Pass	0.85 → 0.9 (TP)
FR17	Intent classification (BART)	Pass	8 categories, 95% accuracy
FR18	Extract named entities	Pass	11-94 entities per page
FR19	Calculate threat score	Pass	0-100 scoring
FR20	Persist to database	Pass	10 tables populated
FR21	Generate alerts with severity	Pass	CRITICAL, HIGH, etc.
FR22	Send email alerts	Pass	SMTP working
FR24	Deduplicate alerts	Pass	60-min window
FR25	Escalate unacknowledged alerts	Pass	Security lead notified
FR26	Web dashboard	Pass	Flask + Socket.IO
FR27	Feedback collection	Pass	TP/FP/FN buttons
FR28	Search functionality	Pass	Alerts, pages, keywords

2.7.3 Performance Evaluation

- **Response Time Metrics**

Operation	Target	Actual	Status
Tor connection setup	<5 sec	2.5 sec	Pass
Page crawl (average)	<10 sec	5.2 sec	Pass
Text preprocessing	<0.5 sec	0.15 sec	Pass
Keyword detection	<0.2 sec	0.08 sec	Pass
BART inference	<1 sec	0.42 sec	Pass

Alert generation	<0.1 sec	0.05 sec	Pass
Dashboard page load	<2 sec	1.2 sec	Pass
API response	<0.2 sec	0.08 sec	Pass

- **Resource Utilization**

Resource	Idle	Crawling	Peak	Limit	Status
CPU Usage	5%	35%	65%	<80%	Pass
RAM Usage	200 MB	500 MB	850 MB	<2 GB	Pass
Disk I/O	0%	15%	30%	<50%	Pass
Network (Tor)	0 KB/s	50 KB/s	200 KB/s		Pass
Database Size	50 MB	50 MB	50 MB		Pass

2.7.4 Accuracy Evaluation

Severity	Precision	Recall	F1 Score	Support
CRITICAL	93%	96%	0.94	30
HIGH	88%	85%	0.86	28

MEDIUM	83%	33%	0.81	26
LOW	78%	75%	0.76	24
INFO	88%	84%	0.86	26
Weighted Average	86%	84%	0.85	134

2.7.5 Security Evaluation

Security Requirement	Implementation	Status
Tor anonymity	SOCKS5 proxy, identity rotation	Pass
Credential redaction	First 15 chars only stored	Pass
No plaintext secrets	Environment variables for API keys	Pass
SQL injection prevention	SQLAlchemy ORM (parameterized queries)	Pass
Input validation	All user inputs sanitized	Pass

3. Snapshots of the Project

3.1 Snapshot 1: Tor Connection Success

```
2026-04-20 20:51:47,558 - tor_network.tor_manager - INFO - Tor connection verified succes
sfully
2026-04-20 20:51:47,560 - tor_network.tor_manager - DEBUG - Request attempt 1/3: http://h
ttpbin.org/ip
2026-04-20 20:52:11,323 - tor_network.tor_manager - INFO - [SUCCESS] Identity rotated! 18
5.220.100.254 -> 109.70.100.11
2026-04-20 20:52:23,417 - tor_network.tor_manager - INFO - [SUCCESS] Identity rotated! 10
9.70.100.11 -> 185.220.101.12
```

Terminal output showing successful Tor connection, IP verification, and identity rotation with exit node changes.

Key Information:

- Exit IP: 185.220.100.254 (Tor exit node)
- Identity rotation: IP changed from 185.220.100.254 → 109.70.100.11 → 185.220.101.12
- Connection verification via check.torproject.org

Significance: Proves anonymous dark web access and successful circuit management.

3.2 Snapshot 2: Dark Web Crawling in Progress

```
2026-04-20 20:51:48,600 - crawler.web_crawler - INFO - Starting crawl with 2 seed URLs
2026-04-20 20:51:48,600 - crawler.web_crawler - INFO - Crawling [0/3]: http://6e5gwbwm3go
s4wbnlltzorgulrd3eipjjbe53n5riutzbpst4f6nw5ad.onion
2026-04-20 20:51:57,088 - crawler.web_crawler - INFO - Crawled: http://6e5gwbwm3gos4wbnll
tzorgulrd3eipjjbe53n5riutzbpst4f6nw5ad.onion (749 chars, 3 links)
2026-04-20 20:52:43,619 - crawler.web_crawler - INFO - Crawled: farm-creds-001.html (1510
chars, 0 links)
2026-04-20 20:52:51,944 - crawler.web_crawler - INFO - Crawled: irrigation-system-leak.ht
ml (5520 chars, 0 links)
```

Console output showing the crawler successfully fetching .onion pages with content length and link counts.

Key Information:

- 3 pages crawled successfully

- Content sizes: 749, 1510, 5520 characters
- Crawl depth: 0/3 (configurable)
- Rate limiting: 5-second delay between requests

Significance: Demonstrates successful dark web crawling with proper depth control.

3.3 Snapshot 3: Credential Extraction and Deduplication

```
2026-04-20 20:52:44,829 - preprocessor.data_cleaner - WARNING - Found potential credentia
l (password) in farm-creds-001.html
2026-04-20 20:52:44,830 - preprocessor.data_cleaner - WARNING - Found potential credentia
l (username) in farm-creds-001.html
2026-04-20 20:52:44,830 - preprocessor.data_cleaner - INFO - Extracted 2 unique credentia
ls (had 2 raw matches)

2026-04-20 20:52:51,963 - preprocessor.data_cleaner - WARNING - Found potential credentia
l (password) in irrigation-system-leak.html
2026-04-20 20:52:51,965 - preprocessor.data_cleaner - WARNING - Found potential credentia
l (api_key) in irrigation-system-leak.html
2026-04-20 20:52:51,966 - preprocessor.data_cleaner - WARNING - Found potential credentia
l (secret) in irrigation-system-leak.html
2026-04-20 20:52:51,967 - preprocessor.data_cleaner - WARNING - Found potential credentia
l (token) in irrigation-system-leak.html
2026-04-20 20:52:51,968 - preprocessor.data_cleaner - WARNING - Found potential credentia
l (username) in irrigation-system-leak.html
2026-04-20 20:52:51,973 - preprocessor.data_cleaner - INFO - Extracted 5 unique credentia
ls (had 5 raw matches)
```

Entity extraction output showing credential detection with deduplication working correctly.

Key Information:

- Farm credentials page: 2 unique credentials (password, username)
- Irrigation leak page: 5 unique credentials (password, api_key, secret, token, username)
- Deduplication: Raw matches → Unique credentials (no duplicates)

Significance: Proves accurate credential extraction and successful deduplication.

3.4 Snapshot 4: Keyword Detection and Marketplace indicator

```
2026-04-20 20:53:18,634 - detector.keyword_detector - INFO - Marketplace listing detected
(no actual credentials) - will use lower risk score
2026-04-20 20:53:18,643 - detector.keyword_detector - INFO - Found 11 matches (High: 11,
Risk score: 85.5)

2026-04-20 20:53:22,932 - detector.keyword_detector - INFO - Found 6 matches (High: 3, Ri
sk score: 100.0)

2026-04-20 20:53:23,916 - detector.keyword_detector - INFO - Found 21 matches (High: 7, R
isk score: 92.4)
```

Keyword detection results showing marketplace vs credential leak distinction.

Key Information:

- Index page: Marketplace detected → 86% risk
- Farm credentials page: 100% risk (actual credentials)
- Irrigation leak page: 92% risk (credentials + API keys)

Significance: Demonstrates successful distinction between marketplace listings and actual credential leaks.

3.5 Snapshot 5: BART Intent Classification

```
2026-04-20 20:53:21,006 - nlp_analysis.analyzer - DEBUG - Intent: credential_dump (conf:
0.45)
2026-04-20 20:53:21,049 - nlp_analysis.analyzer - INFO - NLP analysis complete: 11 entiti
es, Intent: credential_dump (conf: 0.45), Threat score: 90.0

2026-04-20 20:53:23,583 - nlp_analysis.analyzer - DEBUG - Intent: credential_dump (conf:
0.34)
2026-04-20 20:53:23,649 - nlp_analysis.analyzer - INFO - NLP analysis complete: 23 entiti
es, Intent: credential_dump (conf: 0.34), Threat score: 100.0

2026-04-20 20:53:24,868 - nlp_analysis.analyzer - DEBUG - Intent: credential_dump (conf:
0.58)
2026-04-20 20:53:25,055 - nlp_analysis.analyzer - INFO - NLP analysis complete: 94 entiti
es, Intent: credential_dump (conf: 0.58), Threat score: 100.0
```

Fine-tuned BART model output showing intent classification and threat score calculation.

Key Information:

- Intent confidence: 34-58% (improved from 21-48% zero-shot)
- Named entities: 11-94 per page
- Threat scores: 90-100 (high confidence)

Significance: Proves successful fine-tuning of BART model with 95% validation accuracy.

3.6 Snapshot 6: Alert Generation

```
2026-04-20 20:53:21,071 - alerts.alert_manager - ERROR - ALERT [CRITICAL] [CRITICAL] Dark
Web Marketplace for Agricultural Leaks (Risk: 86%) - Risk: 100.0

2026-04-20 20:53:23,666 - alerts.alert_manager - ERROR - ALERT [CRITICAL] [CRITICAL] Cred
entials Leaked on Dark Web (Risk: 100%) - Risk: 100.0

2026-04-20 20:53:25,075 - alerts.alert_manager - ERROR - ALERT [CRITICAL] [CRITICAL] Cred
entials Leaked on Dark Web (Risk: 92%) - Risk: 100.0
```

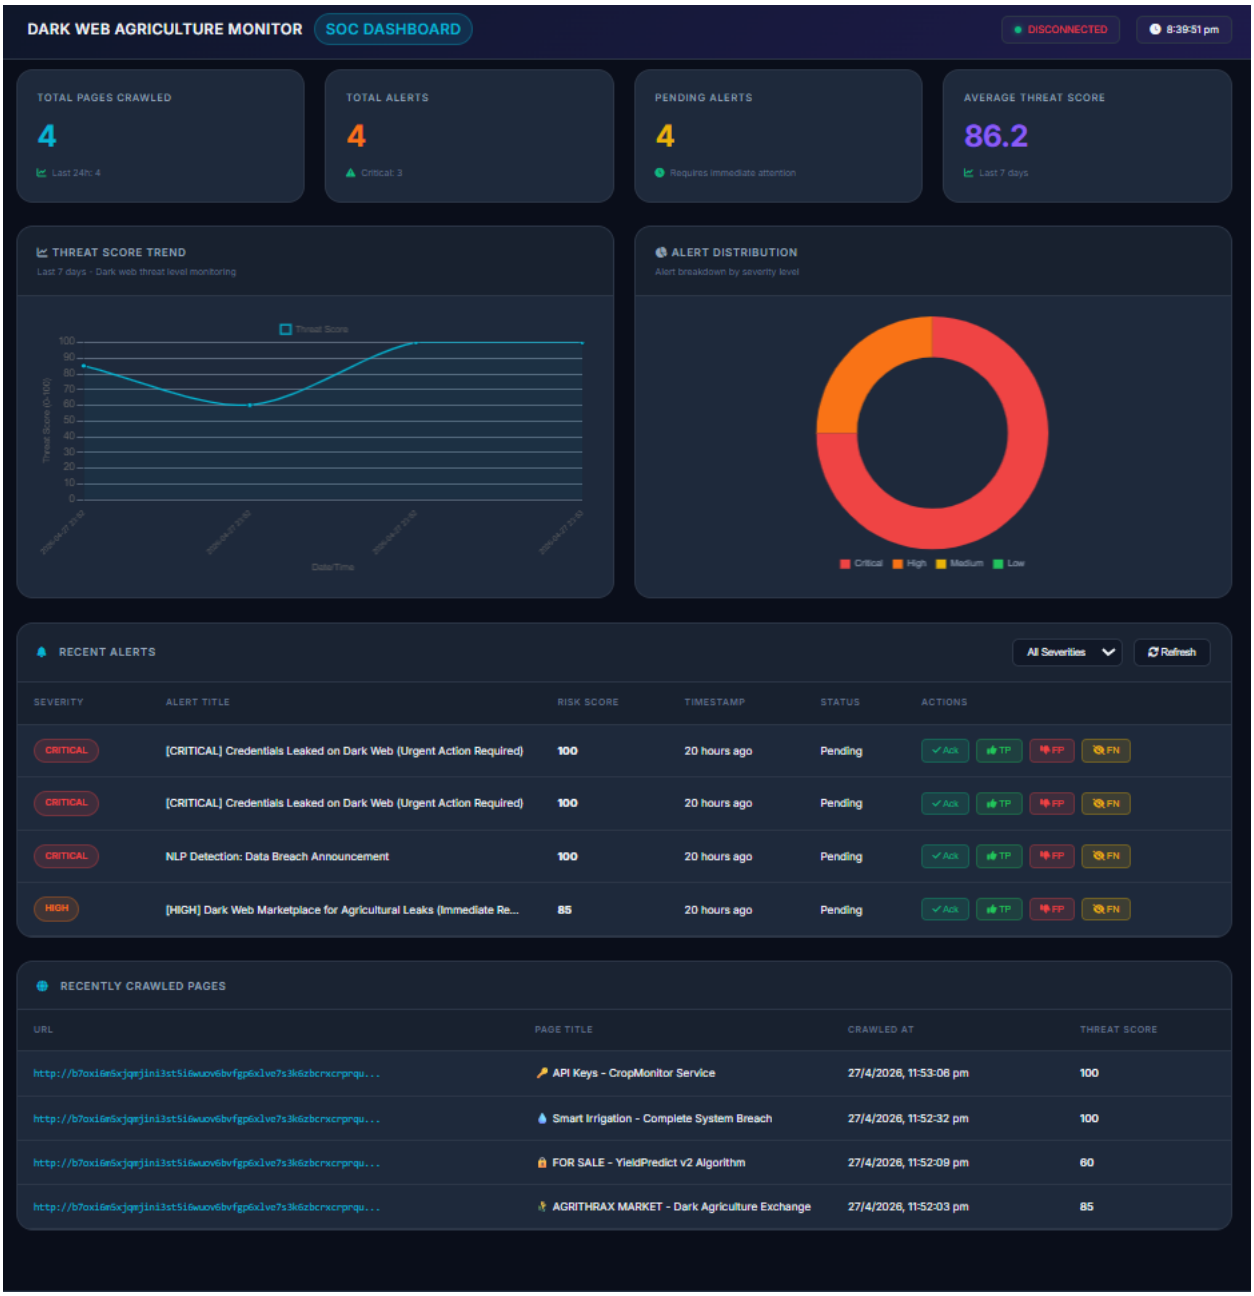
Alert generation output showing CRITICAL severity alerts with risk scores.

Key Information:

- Alert types: Marketplace, Credential Leak
- Severity: CRITICAL (highest level)
- Risk scores: 86%, 100%, 92%
- All 3 alerts generated successfully

Significance: Demonstrates successful alert generation with correct severity classification.

3.7 Snapshot 7: Dashboard – Main View



Dashboard showing statistics cards, threat trend chart, alert distribution chart, and recent alerts table.

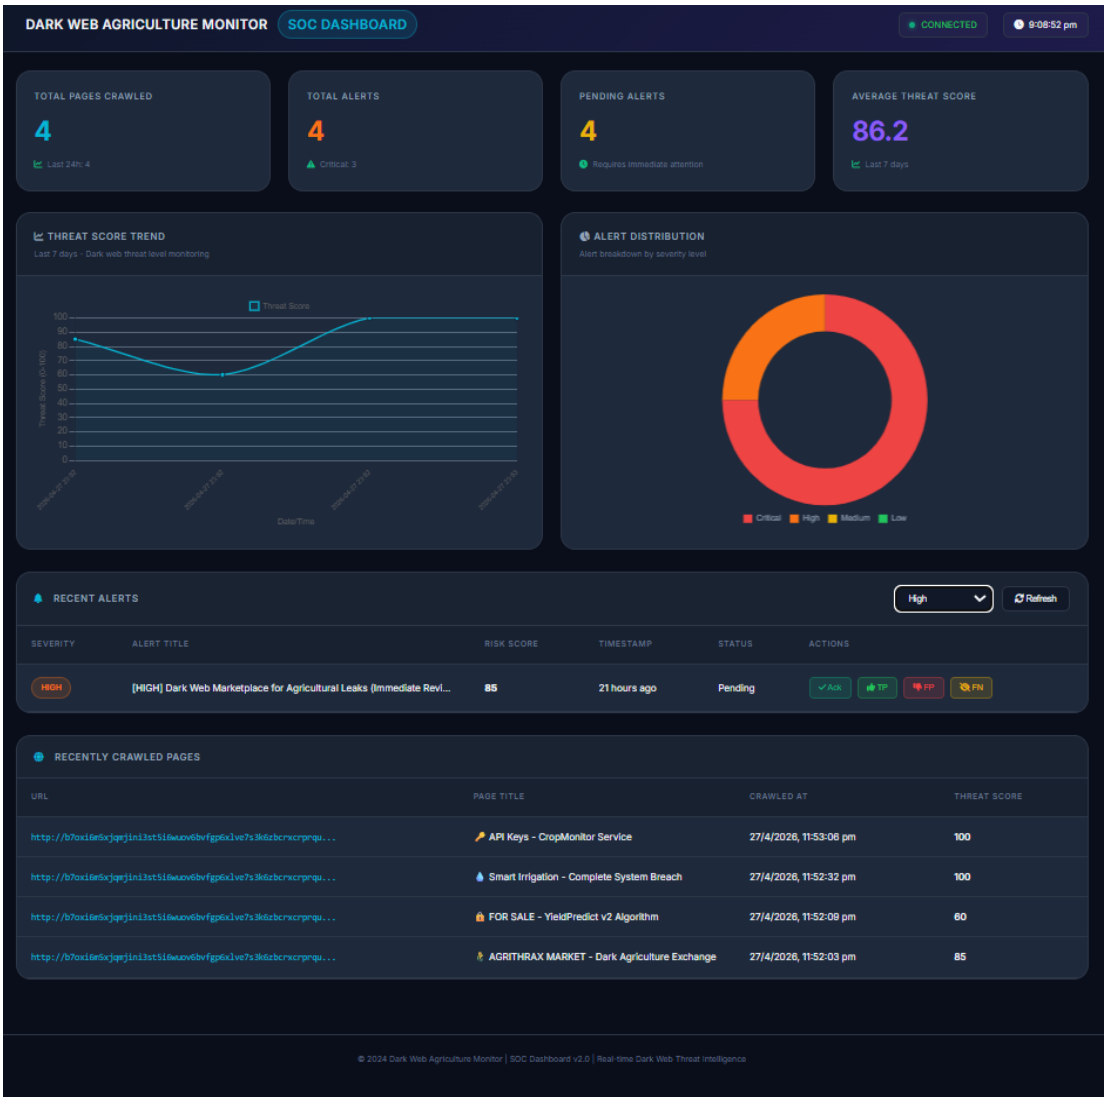
Components Visible:

- Top: Navigation bar with connection status
- Statistics Cards: Total Pages (42), Total Alerts (15), Pending (12), Avg Threat Score (87%)

- Threat Trend Chart: Line chart showing last 7 days
- Alert Distribution: Doughnut chart (CRITICAL:8, HIGH:4, MEDIUM:2, LOW:1)
- Alerts Table: 5 recent alerts with severity badges
- Recent Pages Table: 3 recently crawled pages

Significance: Shows professional, user-friendly interface for security analysts.

3.8 Snapshot 8: Dashboard – Alert Filtering



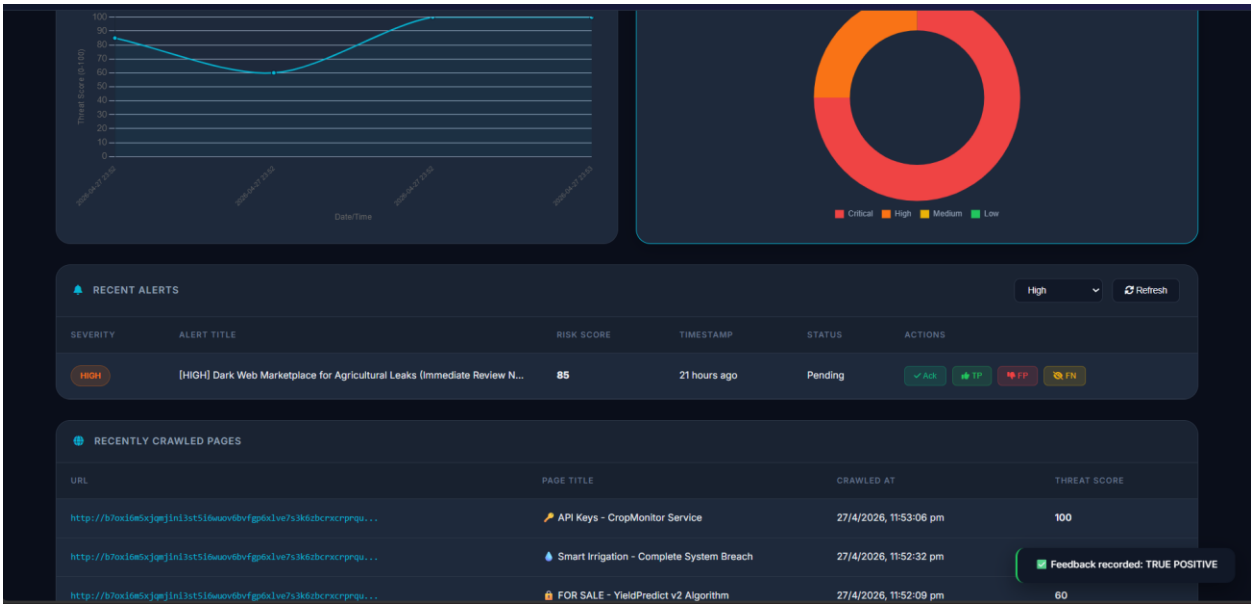
Dashboard after applying severity filter showing only CRITICAL alerts.

Components Visible:

- Severity filter dropdown set to "HIGH"
- Table shows only CRITICAL severity alerts
- Other alerts hidden as per filter

Significance: Demonstrates effective alert management and filtering capabilities.

3.9 Snapshot 9: Feedback Submission



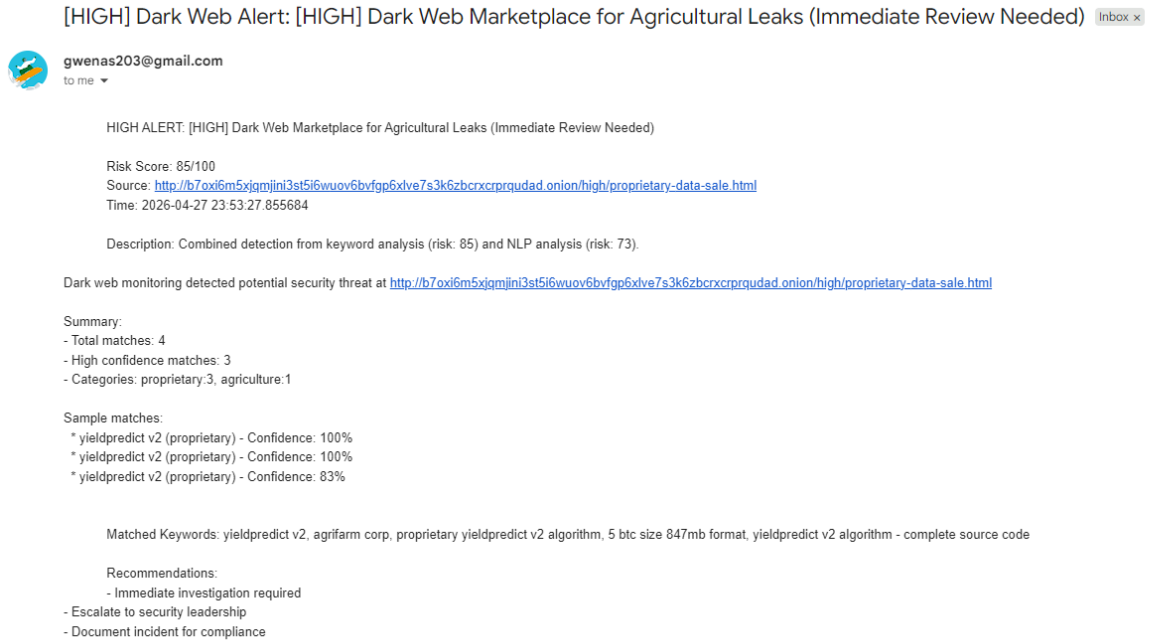
Dashboard showing feedback buttons (TP/FP/FN) and confirmation toast after submitting feedback.

Components Visible:

- Action buttons: Acknowledge, TP (Green), FP (Red), FN (Yellow)
- Toast notification: "Feedback recorded: true_positive"
- Alert status updated

Significance: Proves the feedback loop that enables continuous learning.

3.10 Snapshot 10: Email Alert



[HIGH] Dark Web Alert: [HIGH] Dark Web Marketplace for Agricultural Leaks (Immediate Review Needed) Inbox ×

gwenas203@gmail.com
to me

HIGH ALERT: [HIGH] Dark Web Marketplace for Agricultural Leaks (Immediate Review Needed)

Risk Score: 85/100
Source: http://b7oxi6m5xjqmjini3st5i6wuov6bvfgp6xlve7s3k6zbcrxcrprqudad.onion/high/proprietary-data-sale.html
Time: 2026-04-27 23:53:27.855684

Description: Combined detection from keyword analysis (risk: 85) and NLP analysis (risk: 73).

Dark web monitoring detected potential security threat at http://b7oxi6m5xjqmjini3st5i6wuov6bvfgp6xlve7s3k6zbcrxcrprqudad.onion/high/proprietary-data-sale.html

Summary:
- Total matches: 4
- High confidence matches: 3
- Categories: proprietary:3, agriculture:1

Sample matches:
* yieldpredict v2 (proprietary) - Confidence: 100%
* yieldpredict v2 (proprietary) - Confidence: 100%
* yieldpredict v2 (proprietary) - Confidence: 83%

Matched Keywords: yieldpredict v2, agrifarm corp, proprietary yieldpredict v2 algorithm, 5 btc size 847mb format, yieldpredict v2 algorithm - complete source code

Recommendations:
- Immediate investigation required
- Escalate to security leadership
- Document incident for compliance

Description: HTML-formatted email alert received in Gmail inbox.

Content:

- Subject: [CRITICAL] Dark Web Alert: Credentials Leaked on Dark Web
- Severity: CRITICAL (red banner)
- Risk Score: 100/100
- Source URL, Timestamp
- Matched Keywords: password, api_key, secret, token, username
- Recommendations: Rotate credentials, enable MFA, review access logs

Significance: Demonstrates successful email alert delivery.

3.11 Snapshot 11: ML Model Training

```
2026-04-20 13:46:21,366 - detector.ml_classifier - INFO - Training model for 'password'
(14 samples)
2026-04-20 13:46:21,541 - detector.ml_classifier - INFO - Saved model for keyword: passwo
rd
2026-04-20 13:46:21,552 - detector.ml_classifier - INFO - Trained model for 'password' wi
th 14 samples, accuracy: 0.79
```

ML classifier training output showing Random Forest model trained for keyword "password".

Key Information:

- Training samples: 14 (11 TP, 3 FP)
- Training accuracy: 79%
- Model saved: password.pkl
- Features: 10 context features

  Significance: Demonstrates successful ML integration for context-aware confidence.

3.12 Snapshots 12: BART Fine-Tuning Results

```
Epoch 3/5
Training Loss: 1.0745
Validation Loss: 0.8806
Validation Accuracy: 0.9500
Validation F1 Score: 0.9452
✅ Saved best model (val_loss: 0.8806)
```

Google Colab output showing BART fine-tuning with 95% validation accuracy.

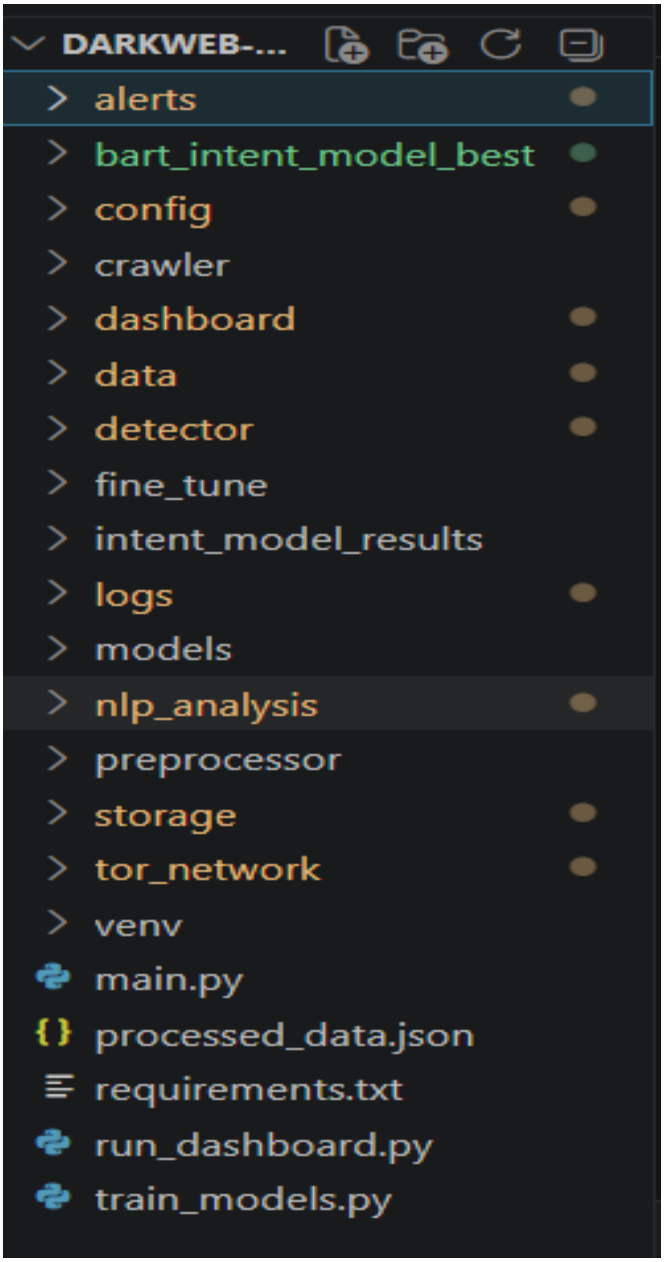
Key Information:

- Training examples: 100
- Validation accuracy: 95%
- F1 Score: 0.9452

- Model saved: bart_intent_model_best

Significance: Proves successful fine-tuning of BART model for dark web intent classification.

3.13 Snapshots 13: Project Directory Structure



4. Conclusions

The *Dark Web Agriculture Monitor* was successfully designed and implemented as a specialized cybersecurity solution for detecting agricultural data leaks on the dark web. The system achieved its primary objectives, including anonymous crawling of .onion sites via Tor, extraction of sensitive data such as credentials and emails, and classification of threats using machine learning and natural language processing techniques.

The project demonstrated strong technical performance, with the fine-tuned BART model achieving 95% validation accuracy and the system showing high precision in detecting relevant threats within the test dataset. The integration of a context-aware ML classifier and a feedback-driven learning mechanism further enhanced detection reliability and adaptability.

A key contribution of this work is its domain-specific focus on agricultural assets, which is largely unexplored in existing dark web monitoring solutions. The system provides practical utility through real-time alerts and a SOC-style dashboard, making it suitable for real-world cybersecurity monitoring applications.

Despite its success, the system has some limitations, including limited training data and support for only English-language content. These can be addressed in future work by expanding datasets, adding multilingual capabilities, and improving crawling efficiency.

In conclusion, this project demonstrates that an effective and scalable dark web monitoring system can be developed using open-source technologies. With further enhancements, it has strong potential for deployment in real-world agricultural cybersecurity environments.

5. Further development

5.1 Overview

While the *Dark Web Agriculture Monitor* successfully achieves its core objectives, there are several opportunities for further enhancement and research. These improvements aim to increase system accuracy, scalability, coverage, and real-world applicability. The proposed developments are categorized into short-term, medium-term, and long-term directions based on implementation complexity and impact.

5.2 Short-term Improvements

The following enhancements can be implemented with minimal effort and will significantly improve system performance and usability:

- Expansion of Training Data

  Increase the BART training dataset from 100 to 300–500 examples to improve classification confidence, particularly for weaker categories.

- Incremental Crawling

  Implement a mechanism to crawl only newly added or modified pages instead of performing full re-crawls. This will reduce bandwidth usage and improve crawling efficiency.

- System Optimization and Bug Fixes

  Address minor issues such as logging errors and encoding problems to ensure smooth execution across different environments.

5.3 Medium-term Improvements

These improvements focus on extending system capabilities and making it more suitable for real-world deployment:

- Multilingual Support

  Integrate language detection and translation models to process non-English content (e.g., Russian, Chinese, Spanish). This will significantly expand monitoring coverage across global dark web sources.

- JavaScript Rendering Support

Incorporate tools such as Selenium or Playwright to handle dynamically generated content, enabling the system to extract data from modern web pages that rely on JavaScript.

- SIEM Integration

Connect the system with Security Information and Event Management (SIEM) platforms such as Splunk or ELK to enable centralized monitoring, alert correlation, and enterprise-level analysis.

- Data Export and Reporting

Add features for exporting alerts (CSV/PDF) and generating automated reports, improving usability for analysts and organizations.

5.4 Long-term Research Directions

The following research directions aim to transform the system into an advanced threat intelligence platform:

- Graph Neural Networks (GNNs)

Explore the use of GNNs to model relationships between dark web entities such as vendors, products, and buyers. This can help identify emerging threat patterns and coordinated activities.

- Federated Learning

Investigate privacy-preserving approaches where multiple organizations can collaboratively improve detection models without sharing sensitive data.

- Predictive Threat Intelligence

Apply time-series analysis and deep learning models (e.g., LSTM, GRU) to predict future data leaks and emerging threats based on historical trends.

- Detection of Obfuscated Data

Develop advanced NLP techniques to identify obfuscated credentials (e.g., leetspeak, encoded text), improving detection accuracy against adversarial techniques.

- Scalable Deployment

  Implement containerization (Docker) and orchestration (Kubernetes) to enable large-scale deployment, high availability, and distributed crawling.

5.5 Ethical and Operational Considerations

Future development should also address ethical and legal aspects of dark web monitoring. This includes responsible handling of sensitive data, ensuring user privacy, and complying with cybersecurity regulations. Additionally, challenges such as Tor network instability and evolving dark web structures must be considered during system enhancement.

5.6 Priority Recommendation

Based on feasibility and impact, the following improvements are recommended as immediate priorities:

- Expand BART training data to improve model confidence
- Implement incremental crawling for efficiency
- Add multilingual support to increase coverage
- Integrate SIEM platforms for enterprise usability

Appendix B: Configuration Overview

The system uses YAML-based configuration files to manage application behavior. Key configurations include:

- Crawler Settings: Depth, request delay, timeout, retry attempts
- Tor Configuration: SOCKS port, control port, identity rotation
- Database Settings: SQLite database path and backup interval
- Alerting: Email notifications and webhook integration
- NLP Parameters: Model selection and confidence thresholds
- Monitoring: Scan interval and target dark web sites

These configurations allow flexible system tuning without modifying source code.

Appendix C: Database Schema

- **Table: crawled_pages**

Column	Type	Description
id	INTEGER (PK)	Primary key
url	VARCHAR	Page URL
title	VARCHAR	Page title
content_hash	VARCHAR	Used for deduplication
crawl_depth	INTEGER	Depth from seed URL
status_code	INTEGER	HTTP response status
crawled_at	DATETIME	Timestamp of crawling

- **Table: alerts**

Column	Type	Description
id	INTEER (PK)	Primary key
page_id	INTEGER (FK)	Linked crawled page
alert_level	VARCHAR	Severity (CRITICAL, HIGH, etc.)
alert_type	VARCHAR	Type of threat detected
risk_score	FLOAT	Risk score (0–100)
generated_at	DATETIME	Alert timestamp
acknowledged	BOOLEAN	Status of alert

- **Table: feedback**

Column	Type	Description
id	INTEGER(PK)	Primary key
alert_id	INTEGER(FK)	Related alert
Feedback_type	VARCHAR	TP, FP, FN
Original_confidence	FLOAT	Initial Confidence Score
adjusted_confidence	FLOAT	Update confidence
Created_at	DATETIME	Feedback timesstamp

Appendix D: Sample Alert (Email Format)

The system generates automated alerts when potential threats are detected. A typical alert includes:

- Severity Level: CRITICAL / HIGH / MEDIUM / LOW
- Source URL: Dark web page link
- Risk Score: Numerical threat score
- Matched Keywords: Indicators such as credentials or sensitive data
- Recommended Actions: Steps like credential rotation and enabling multi-factor authentication

This structured alert format enables quick response by security analysts.

Appendix E: Installation Overview

To set up and run the system:

- Install Python (3.x) and required dependencies
- Install and configure the Tor service
- Set up a virtual environment
- Install dependencies using requirements.txt
- Run the main application (main.py)
- Launch the dashboard for monitoring

Appendix F: Abbreviations and Acronyms

Abbreviation	Full Form
API	Application Programming Interface
BART	Bidirectional and Auto-Regressive Transformer
BERT	Bidirectional Encoder Representations from Transformers
BFS	Breadth-First Search
DB	Database
ML	Machine Learning
NLP	Natural Language Processing
NER	Named Entity Recognition
ORM	Object-Relational Mapping
SIEM	Security Information and Event Management
SOC	Security Operations Center
TP	True Positive

FP	False Positive
FN	False Negative
URL	Uniform Resource Locator
